Operator Manual

Midline and Space Saver Urns 7000, 8000, and 9000 Series

Model 8116(E)

Model 7773(E)

US (some models)

- Electric heated models have suffix (E).
- Steam heated models have suffix (S).
- Heat exchange urns start in 74, 80, 81, 84, 91 or 99, all without suffix (P).
- Pump models begin in 72, 73, 77, 82, 83, 87, 93, CH, or Models 81 and/or 91 with the second suffix (P).

Your model number is found on the nameplate of the urn.

Safety Information

Important Safety Information

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

For your safety and the safety of others, read all warnings and the operator manual before installing or using the product.

DANGER: This term warns the user of imminent hazard that will result in serious injury or death.

WARNING: This term refers to a potential hazard or unsafe practice, which could result in serious injury or death.

CAUTION: This term refers to a potential hazard or unsafe practice, which could result in minor or moderate injury.

NOTICE: This term refers to information that needs special attention or must be fully understood.

WARNING

To reduce risk of electrical shock, do not remove side panels. No user-serviceable parts inside. Repair should be done by authorized service personnel only.

The appliance is not intended for outdoor use.

Do not clean with pressurized water or use in an area where pressurized water may be used.

Cleaning and maintenance shall be made only by properly trained persons with supervision.

This appliance is not intended for use by persons with reduced physical, sensory, or mental capabilities, or lack of experience and knowledge, unless they have been given supervision or instruction concerning use of the appliance by a person responsible for their safety.

Children should be supervised to ensure that they do not play with the appliance.

Do not alter or deform the power cord or plug in any way! Altering or deforming the plug may cause electrical shock, damage unit and will void warranty.

To reduce risk of explosion or fire, do not use near combustibles.

CAUTION

For safe and proper operation the appliance must be placed in a stable, vertical position.

To reduce risk of serious burns or scalding, do not place hand or other body parts under dispenser or container while product is brewing.

Always unplug unit from power supply before servicing.

Hot liquid in brew basket could cause burns. Remove with care.

Surfaces are hot and can cause burns.

NOTICE

Use only on a circuit that is properly protected and capable of the rated load.

Electronically ground the chassis.

Follow national and local electrical codes.

Do not use extension cord.

This equipment must be installed in compliance with applicable Federal, State, and/or Local plumbing codes having jurisdiction. This product requires an approved back flow prevention water device, such as a double check valve, to be installed between the machine and the water supply.

Installation

Unpacking Instructions

Carefully unpack the machine and inspect immediately for shipping damage. The packaging may contain unattached parts. Your machine was shipped in a carton designed to give it maximum protection in normal handling. It was thoroughly inspected before leaving the factory. In case of damage, contact the shipper, not Grindmaster-Cecilware.

NOTICE: The person installing this appliance is responsible for ensuring that electric and water connections meet the requirements of the national electric code, national plumbing code, and any local ordinances.

DO NOT RUN TUBING, PIPES, CONDUIT, OR CABLE UNDER CENTER PORTION OF URNS. THIS AREA MUST BE KEPT CLEAR FOR SERVICING URN CONTROLS.

See **Rough-in Drawings** for dimensions and locations of electric and water input.

Mechanical Installation

⚠ WARNING: ELECTRIC SHOCK HAZARD!
Installation of this appliance should be performed by qualified service personnel only. Improper installation could result in electrocution.

⚠ CAUTION
These urns are heavy pieces of equipment. It is recommended that moving or lifting the unit be done by two people to avoid injury.

NOTICE: This brewer should be installed by a knowledgeable and experienced commercial equipment installer.

1. Inspect unit to see if any damage occurred in shipment.
2. Remove the urn from the packing material and attach its legs.
3. Position the brewer on a strong, stable table or counter.
4. Position urn so that the faucets drip into a drip trough or drain receptacle of some type.
5. Level urn both front to back and left to right. The feet are adjustable for this purpose.

Water Hook-up

NOTICE: This equipment must be installed in compliance with applicable Federal, State and/or Local plumbing codes having jurisdiction. This product requires an approved back flow prevention water device, such as a double check valve, to be installed between the machine and the water supply. Incoming

pressure should be greater than 30 psi and not more than 70 psi.

1. Cold or hot water (160°F. maximum) may be used. Heat input capacity is ample for the coldest water, and cold water should be used for best brewing results.
2. Provide shut-off valve and union in supply line near urn.
3. Minimum inlet pressure at urn should be 30 PSI.
4. Maximum inlet pressure recommended at 70 PSI.
5. Copper flex tubing should be used for valve connections.
6. To ensure pressure at the urn of at least 30 PSI, use 3/8" OD tubing for short runs, 1/2" OD tubing for longer runs, and larger size tubing for unusually long runs. Be sure other appliances will not reduce water pressure excessively.
7. Turn on the water supply line and check for leaks.

NOTE: For the best tasting coffee, add a filtering system to the water supply line to eliminate any taste and/or odor from the water.

Steam Heated Urns, Models with suffix (S):

1. Steam supply line should have a shut-off valve ahead of the urn. (A strainer and control valve are located in the urn's control compartment.)
2. Steam return lines should be connected to a high-quality steam trap. Also, we recommend including a bypass and test valve to check trap operation while in service.
3. Use unions and/or copper tubing on both the supply and return connections to avoid strain on the urn.
4. A cord and plug (NEMA-5-15P), are attached for electrical control power. Plug cord into a nearby 115 volt, 15 amp, grounded wall outlet, only after the water line is turned on.

Electrical Hook-up

NOTICE: This equipment must be installed in compliance with applicable Federal, State, and/or Local electrical codes having jurisdiction. Do not use extension cords. Make sure that the outlet the urn plugs into is grounded.

1. Check rating marking on urn nameplate to be sure electric lines match voltage, phase, and amperage requirements of urn. Select the proper cord and cord grip for electrical rating of the urn. The cord must be an oil resistant type such as SO, SOO, STO, STOO, SEO, SJO, SJOO, SJTO, SJTOO, SJEO, HSO, HSOO, HSJO, or HSJOO. Alternatively, flexible metal conduit and type THHN wires may be used.

Installation (continued)

Electrical Hook-up (continued)

▲ WARNING: ELECTRIC SHOCK HAZARD!

Installation of this appliance should be performed by qualified service personnel only. Improper installation could result in electrocution.

2. The terminal block and ground screw are located behind a cover plate on the front, right side of the urn, or inside the control box mounted on right hand side of midline equipment.
3. A neutral wire is normally required on all single phase and on 208 Volt, 3 phase power supplies to operate 120 VAC control circuit. In the case of single phase, 2 wire service (no neutral), or 3 phase 3 wire service (no neutral), a separate 120 VAC cord and plug (NEMA 5-15P) supplies 120 VAC power to the control circuit (or for use of transformer on heat exchange urns). This cord must be ordered separately.

▲ WARNING: ELECTROCUTION HAZARD!

Never use the ground conductor as a neutral. This could cause electrocution.

4. A fused disconnect switch should be installed near urn.
5. **Urn body MUST be grounded.** A grounding terminal is provided for this purpose.
6. Use only copper wire to connect this urn.

Start up

1. Open water supply line valve to urn.
2. Turn on or plug in the power supply to the urn. Water compartment will begin to fill automatically. Do not power up the urn when the water line is off.
3. Pump urns have a fast fill feature. Pump urns have model numbers beginning in 72, 73, 77, 82, 83, 87, 93, and CH with any suffix, or may be any model with second suffix (P). To fill the urn in only ten minutes on these models:
 - a) Disconnect power to the urn.
 - b) Remove the control drawer in the center, underneath the urn. On triple urns, remove the left drawer. On Midline and Chinese Tea Urns, remove the cover on the side of the control box. Leave the drawer sitting under the urn, making certain no uninsulated live parts are touching the urn body.
 - c) Locate the FAST FILL VALVE which is a labeled screw type valve on the water inlet assembly - left side facing the urn.
 - d) Open the valve completely.
 - e) Leave the control drawer disconnected and restore power. The urn should fill in about ten minutes.
 - f) Disconnect power.

g) Close the valve until it is snug. There is no need to tighten.

h) Reattach the control drawer to the urn. Restore power.

4. Turn the thermostat knob in front of housing to BREW position. Pilot light on top of thermostat bezel will illuminate. Water in urn will heat up, and thermometer pointer will rise to high end of BREW zone on thermometer dial. It will take approximately 45 minutes to heat water, depending on inlet water temperature, and urn heater wattage. Pilot light on top of thermostat bezel will go out when water in urn is at brew temperature.
5. Brew and discard at least one batch of water into each liner. Check that the fill level is correct. See the adjustments section if changes are needed.

Operation

▲ CAUTION: HOT LIQUID HAZARD

Water used for brewing coffee is very hot. Use caution when brewing, pouring, or transporting coffee. Accidental spills may result in severe burns.

▲ CAUTION: HOT LIQUID HAZARD

Coffee basket contains very hot water until the drip is completed. Early removal of a dripping basket could result in burns.

1. Place filter paper in brew basket with designated amount of coffee grounds. Coffee experts recommend from 6 to 10 ounces of coffee per gallon of water. Make certain you have a level bed of coffee. Consult your coffee supplier for exact brewing specifications. Acceptable filter paper sizes are:

Liner size	Filter size	Grindmaster Part #
1.5 gallon	13" x 5"	ABB1.5WP
3 gallon	18" x 6"	ABB3WP
6 gallon	21" x 9"	ABB6WP
10 gallon	25" x 11"	ABB810WP
2. Replace cover. Lift and rotate the spray arm to position the nozzle in the hole on the basket cover.
3. Set the batch size toggle for a full or half batch. Press the start button on timer.
4. The brew cycle takes from 2 to 15 minutes depending on the size of the urn. When the brew is finished, allow one to two minutes for the coffee to drip from the basket.
5. When the drip period is complete, center the spray arm and remove the basket to throw away the grounds. Replace the liner cover to keep the coffee hot.
6. Coffee is ready to serve.
7. Hold brewed coffee at 185 to 190°F by turning to the HOLD setting on thermostat knob.

Adjustments

NOTICE: Urn should be up to temperature before making adjustments of the brew system.

Brew Volume: Sprayover Time and Rate

Timer and sprayover rate are factory set. If other volumes of water or a faster or slower sprayover rate is desired, see following instructions:

Timer Adjustment

The brew timer's full batch may be adjusted. The adjustment screw is located behind the plug under the start and stop buttons. See the figure below. Since the sprayover rate is constant, the length of brew time sets the brew volume. The half batch is exactly 1/2 of the full batch.

Sprayover Rate Adjustment

Pump Urns: models starting in 72, 73, 77, 82, 83, 87, 93, CH, or suffix (P).

A fixed orifice is located in top of spray arm swivel post. The only way to adjust the rate of flow from the spray arm is to drill a larger hole for more sprayover water or replace the existing orifice with a smaller hole size for less sprayover water.

Heat Exchange Urns: models beginning in 74, 80, 81, 84, 91, 99, without suffix (P).

Heat exchange urns have a regulator which adjusts the sprayover rate. The adjustment screw is located under urn in the back of the control drawer on the left side, or inside the control box on the Midline Urns. See **Figure A**. Loosen, CCW, the screw to decrease flow and tighten, CW, the screw to increase the flow. The spray pattern should touch the weld line near the top of the liner.

To set the sprayover rate, follow these steps:

1. Divide the desired brew size by the desired brew time. This is your sprayover rate in gallons per minute.
2. Operate the brew timer for one minute and measure the amount of water. If the volume is higher than your sprayover rate from step 1, decrease the flow. Increase the flow if the volume is too low.
3. Continue the adjustment until the desired rate is achieved.

STOP

START

Figure A

Bypass Adjustment (Refer to **Figure B**)

The bypass adjustment controls the amount of water which bypasses the coffee during the brew. This water dilutes the final brew. If bypass is desired, open red handle on bypass valve. This opening will bypass up to about 40% of total sprayover water. Each complete turn is approximately equal to 5% bypass.

Figure B

Thermostat Adjustment

The thermostat is factory set so that the maximum temperature is about 200° F in heat exchange urns and 195° F in pump urns. This is the high end of brew range on the thermometer and corresponds to the BREW position on the thermostat. The HOLD position is the low end of the brew range on the thermometer, or 185°F.

Water should never boil in the urn. If you need to adjust the maximum setting of the thermostat, do the following:

1. Remove the thermostat knob.
2. Insert small screwdriver into the center of the shaft. Turn the screw slightly clockwise to decrease the temperature.
3. Check the setting by adding cold water to make sure the temperature reaches the high end of the BREW range.

Cleaning

▲ CAUTION: BURN HAZARD

The urn surfaces and water inside jacket are very hot. Use caution when cleaning this urn to prevent burns.

NOTICE: All sanitizing agents in the food zone must comply with 21 CFR 178.1010. Sanitize all food dispensing units periodically. All parts to be sanitized must be cleaned first. Cleaning and sanitizing frequency must follow state and local health department regulations.

After Each Brew:

1. Dispose of grounds and rinse brew basket.

Every Day:

1. Clean liners by rinsing and scrubbing with large, plastic bristle brush.
2. Wipe outside surfaces of the urn with a damp cloth.
3. Clean the brew basket. Remove wire basket insert if needed.
4. Wipe clean the liner covers.
5. Fill the liners with about one gallon of water to prevent coffee oil burn-in.

Weekly or Bi-Weekly, Depending on Use:

1. Fill the urn liners with about one gallon of hot water. Leave the thermostat on BREW.
2. Pour into the liner the recommended concentration of urn cleaner. Excessive amounts of cleaner will attack the stainless steel.
3. Scrub the liner interior with a plastic bristle brush. Rinse and drain the liner.
4. Clean the gauge glasses with a long narrow brush. Rinse.

▲ CAUTION: BURN HAZARD

Do not remove hot water faucet for cleaning. Hot water will empty from jacket, causing burns. To clean water gauge, close shut-off valve at base of gauge assembly.

5. With the liners empty, remove the coffee faucets by unscrewing the large plastic wing-nuts which fasten the faucets. Scrub from the opening into the center of the urn with a long brush.
6. Unscrew the top of the faucet from its body. Scrub faucet body. Clean the silicone seat cup with a soft cloth and soapy water.
7. Reassemble faucets. Fill the liners with hot water and drain until the liner and all parts are completely rinsed.

Maintenance

▲ WARNING: SHOCK AND BURN HAZARD

To prevent electric shock and burn hazard all tasks described in this section are to be performed by a trained and qualified service technician.

The rest of this manual contains information to aid the service technician who is maintaining this equipment. This section has information on performing common service tasks.

Controls, options, and heater wiring diagrams are provided. To find the correct diagram you must know:

- Number of heaters
- Electric ratings (see nameplate for electric ratings)
- One thermostat (standard), or two (option 47: low temp/no brew).
- Air agitation (standard on most models).

To Access Controls:

All controls are located on drawer(s) under the urn, or mounted in control box on the side of the urn. To access these controls:

1. Shut off power to the urn.
2. Remove screws on front of the control drawer, or on side panel for Midline Urns.
3. Drop panel by lowering front and pulling forward. If diagnosis must be made with power on and drawer dropped, be sure no live parts contact body of urn.

To Move the Urn:

▲ CAUTION: BURN HAZARD

This urn is filled with scalding hot water. Always completely drain the jacket and liners and allow to cool before attempting to move this urn. Failure to drain and cool could result in severe burns.

The urn must be completely drained (jacket and liners) and allowed to cool prior to moving this urn.

To Drain the Tank (Jacket):

Note: Read all instructions before draining.

1. Disconnect electric power to the urn.
2. The urn body contains one water tank. It will contain one, two, or three coffee liners, depending on model, that may contain hot liquids.
- 3a. On urns with boiler drain valve with hose connection: Connect a drain hose with garden hose fitting to valve. Make sure other end of drain hose is placed in proper drain receptacle such as a sink. Open drain valve. Be careful, hot water will pour from urn. Make sure the drain hose is capable of withstanding 210°F (100°C) water.
- 3b. On urns provided with petcock type drain valve: Place a pan under the drain. Using pliers or hands with heavy rubber gloves open the valve. Be careful, hot water will pour from the urn. With heavy rubber gloves, push a 3/4" flexible rubber tube over

Maintenance (continued)

▲ WARNING: SHOCK AND BURN HAZARD

To prevent electric shock and burn hazard all tasks described in this section are to be performed by a trained and qualified service technician.

the drain cock. The other end of the tube should be in a proper drain receptacle.

4. Drain each liner by opening the faucet in front of the urn for each liner.
5. Close the drain valve after the urn is drained.

Note: To perform the tasks listed below, the urn must be totally drained and cool.

To Remove a Liner:

1. Unscrew the liner nut at the bottom of the liner. A tool to do this may be purchased from Grindmaster-Cecilware Corporation.
2. Remove any screws on the outside perimeter of the liner ring on the top of the urn.
3. With a rubber mallet, tap the side of the liner near the bottom until the liner is loose. Find and remove the rubber washer which seals the bottom of the liner.

To Replace a Liner:

1. Place a liner washer over the inlet to the coffee tube. You must use a new washer whenever the liner is removed.
2. Place the liner in the urn, lining the hole in the bottom of the liner to the coffee tube.
3. With a rubber mallet, tap the top perimeter of the liner ring to seat the liner on the coffee tube. Tap down evenly along the circumference of the liner ring.
4. Tighten the liner nut at the bottom of the liner.

To Replace a Heater (drain the urn first):

1. Remove the control drawer as described previously. (Refer to section **To Access Controls.**)
2. Locate the heater terminals under the urn, or on the side for Midline equipment.
3. Remove the heater liner which is closest to the terminals.
4. Loosen the heater connection and remove heater. Clean area around holes to make sure you will get a good seal with new heater.
5. Place the copper sealing washer on the new heater with the split toward the element.
6. Position the new heater in the urn and tighten the nut.
7. Be sure the electrical connections are tight. Close the female terminal gap with pliers if it is too loose. Replace the wires if they are damaged.

To replace the thermostat (drain the urn first):

1. Remove the control drawer as described previously. (Refer to section **To Access Controls.**)
2. Locate the fitting on the bottom surface of the urn

which the thermostat capillary passes through.

3. Remove the coffee liner closest to this fitting.
4. Locate the thermostat bulb and remember its location. Some urns have two thermostats.
5. Unwrap the wire holding the bulb.
6. Unscrew the thermostat from the fitting on the bottom of the urn.
7. Disconnect the wires and remove the thermostat.
8. Attach the new thermostat and tighten the capillary tube fitting.
9. Use the wire to attach the bulb to the same location in the urn as the old thermostat.
10. Reattach the liner, as described above, close up the urn, allow the urn to heat to check the temperature setting.
11. On Midline or Chinese Tea Urns, the thermostat is mounted on the control box on the side of the urn.

To Convert Between Single and Three Phase

(on urns with three heaters only, 208-240V only):

Refer to the heater wiring diagram #091-227 at the end of the manual.

Use extra caution in ensuring that all wires are correctly and securely connected.

To Replace a Spray Over Pump on Pump Urns:

1. Disconnect power from urn.
2. Remove the cover over the controls.
3. Locate the brass hose clamp in the control panel. (Usually located in plastic bag with wiring diagrams.)
4. Clamp off intake hose to pump from water jacket. (Hose leading to center of pump.)
5. Disconnect wires from pump to control (label wires).
6. Disconnect ground wire.
7. Slip hoses off pump. Some residual water may exit from hose (2 to 3 ounces).
8. Loosen screws which hold pump in place and remove pump.
9. Retain fittings and mounting bracket for use with replacement pump.
10. Replace pump; be sure it is level. Reconnect wiring, including ground and tubing. Make sure orientation of pump outlet is same as original pump.
11. Restore power to the urn and test.

Maintenance (continued)

Liquid Level Control System

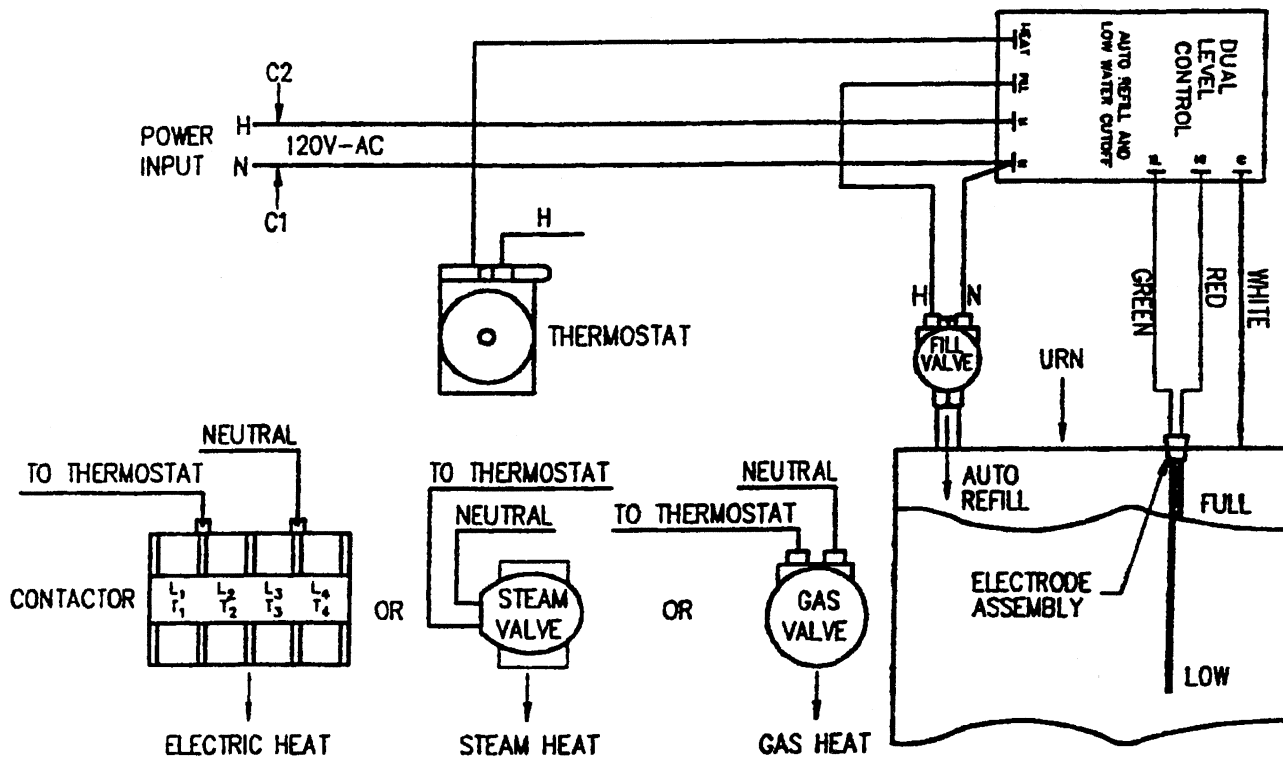

Dual Level Control: What it Does (Refer to **Figure C**):

A) **AUTO REFILL** of the water compartment to keep the tank filled with water. When the water is used, the fill valve opens automatically to let in more water. The fill valve closes when the water level reaches full.

B) **LOW WATER CUTOFF** to prevent burnout of the electric immersion heater when there is not enough water to cover it. When low water occurs, the heat automatically switches off. The heat stays off until more water is added.

Quick Service Check of Liquid Level Control System:

1. All wires secure and properly connected.
2. Clean the electrodes. Lime (mineral scale) build-up can interfere with operation of any liquid control system.

Drawing #090-813

Figure C

Troubleshooting Guide

▲ WARNING: To reduce the risk of electrical shock, unplug the power cord before repairing or replacing any internal components of the unit. Before any attempt to replace a component, be sure to check all electrical connections for proper contact. Only a qualified service technician should perform electrical and mechanical adjustments or repairs.

The following procedures must be performed by a qualified service technician. Disconnect power to machine before servicing.

Before you call for help, please read the following:

Filling Problems			
PROBLEM	POSSIBLE CAUSE	SERVICE CHECK	SOLUTION
Overfilling water tank when power is off.	<ul style="list-style-type: none"> • Fill valve not sealing properly. • Fill valve installed backwards. 	<ul style="list-style-type: none"> • Water entering tank continuously, usually slowly. • Look for direction of arrow on valve body. 	<ul style="list-style-type: none"> • Disassemble valve and clean out debris. Valve may need new plunger if seal is worn. • If arrow on valve is pointing toward water inlet, remove valve and install correctly.
Overfilling water tank only when power is on.	<ul style="list-style-type: none"> • High electrode coated with lime or faulty. • Missing or faulty connection of C terminal on level control to metal enclosure. • Fill valve connected to heat terminal on level control. • Liquid Level Control is faulty. 	<ul style="list-style-type: none"> • Jumper HI terminal on level control to metal enclosure stops fill. • Jumper from C terminal to metal body stops fill. • Check connections. • Jumper from HI to C or metal enclosure does not stop fill. 	<ul style="list-style-type: none"> • Remove electrode assembly and clean both probes. If problem is not corrected, replace electrode assembly. • Make secure connection of C to metal body. • Connect black lead for valve to FILL on level control. • Replace level control.
Tank does not refill.	<ul style="list-style-type: none"> • No electrical power to equipment. • No water supplied to equipment. • Water strainer clogged. • No power to level control. • Level control faulty. • Electrodes faulty. 	<ul style="list-style-type: none"> • Nothing operates. • Cracked water inlet fitting. • Water pressure before strainer but not after. • Check for 120V AC across H and N terminals on level control. • Disconnect probe wire to HI terminal on level control. Check for 120V at FILL terminal. • Tank fills only when probe wire is disconnected from HI terminal on level control. 	<ul style="list-style-type: none"> • Check main switch or circuit breaker, urn's circuit breaker or power switch if provided. • Establish water supply to unit. • Remove and clean or replace strainer's mesh. • If no voltage, check for loose or broken wires. • If no 120V at FILL terminal, replace level control. • Replace electrodes. If no remedy, check for improper wiring or level probe tip touching metal.

Troubleshooting Guide (continued)

▲ WARNING: To reduce the risk of electrical shock, unplug the power cord before repairing or replacing any internal components of the unit. Before any attempt to replace a component, be sure to check all electrical connections for proper contact. Only a qualified service technician should perform electrical and mechanical adjustments or repairs.

Filling Problems (continued)			
PROBLEM	POSSIBLE CAUSE	SERVICE CHECK	SOLUTION
Tank does not refill.	<ul style="list-style-type: none"> • Fill valve faulty. 	<ul style="list-style-type: none"> • 120V is across FILL and N on level control, but no fill. 	<ul style="list-style-type: none"> • Disassemble valve and clean or replace plunger if frozen. If plunger is OK, coil may need replacement.
Heating Problems			
PROBLEM	POSSIBLE CAUSE	SERVICE CHECK	SOLUTION
Tank does not heat.	<ul style="list-style-type: none"> • Low electrode faulty or covered with lime. • Level control faulty. • Thermostat faulty or out of calibration. • Heater contactor coil faulty. (electric heat) • Heater contactor contacts faulty. • Heater faulty. 	<ul style="list-style-type: none"> • Jumper from XL terminal on level control to metal body allows heating. • Check for 120V between H and N terminals on level control. If OK, jumper between XL and metal body and check for 120V between HEAT and N terminals. • Make sure thermostat is turned on. Jumper across thermostat allows heating. • Check for 120V across contactor coil. • Check for heater voltage between each heater pole on contactor and a different terminal pole. • Check resistance across elements with wires disconnected. 	<ul style="list-style-type: none"> • Clean electrode, check wiring. If no remedy, replace electrodes. • If 120V is not at HEAT, replace level control. • Recalibrate thermostat. If no remedy or thermostat does not cycle, replace thermostat. • If correct voltage, but contactor not closing, replace contactor. • If no continuity across contactor when it is closed, replace contactor. • If resistance is much different than 10 to 15 ohms, replace heater.
Recovery time is very long.	<ul style="list-style-type: none"> • Heater faulty. 	<ul style="list-style-type: none"> • see above. 	<ul style="list-style-type: none"> • see above.

Troubleshooting Guide (continued)

⚠ WARNING: To reduce the risk of electrical shock, unplug the power cord before repairing or replacing any internal components of the unit. Before any attempt to replace a component, be sure to check all electrical connections for proper contact. Brewing Problems			
PROBLEM	POSSIBLE CAUSE	SERVICE CHECK	SOLUTION
Brew volume too large or too small.	<ul style="list-style-type: none"> • Timer out of adjustment. • Flow rate is incorrect. • Pressure not adequate at urn. • Lime build-up in heat exchange coil. (heat exchange models only) • Timer faulty 	<ul style="list-style-type: none"> • Compare timer setting to factory setting chart. • Brew batch for one minute and measure volume. Compare to factory setting chart. • Water line must be 3/8" ID and pressure at least 30 PSI. • Brew rate regulator opened completely, pressure OK at urn, but flow is still slow. • Brew time does not match timer setting. Timer not adjustable. 	<ul style="list-style-type: none"> • Adjust timer. • Adjust flow rate. If flow rate cannot be adjusted, check for lime in spray arm, or spray arm post. Water regulator on heat exchange urns may be faulty or need adjustment. • Increase water line size. Plumb line so other equipment does not interfere with pressure. • De-lime heat exchange coil. • Replace timer.
Brew volume erratic.	<ul style="list-style-type: none"> • Pump cavitation (pump models only) • Water supply pressure fluctuates. 	<ul style="list-style-type: none"> • Water temperature above 200° F. • Check water pressure at urn inlet with and without other appliances operating. 	<ul style="list-style-type: none"> • Lower temperature setting. • Plumb water supply so that water pressure is not significantly affected by other appliances. • On Heat Exchange Urns, adjust, repair, or replace regulators.
Note: Small variations from batch to batch are normal.			
Brew cycle will not start.	<ul style="list-style-type: none"> • Timer faulty. • Pump faulty (pump urns only) • Spray arm clogged with lime. • Coil on Heat Exchange Urns clogged. 	<ul style="list-style-type: none"> • Check for 120V between H and N on timer. If OK, check for 120V between BREW and N on timer after pressing start. • 120V between electrical input at pump, but pump does not operate. • Cannot blow through spray arm. • Brew valve opens but no water enters coil. 	<p>If no 120V BREW output from timer, replace timer.</p> <ul style="list-style-type: none"> • Check for lime in pump impeller. Clean or replace impeller. If no remedy, replace pump. • Clean lime out of spray nozzle. • Delime or replace coil.

Troubleshooting Guide (continued)

▲ WARNING: To reduce the risk of electrical shock, unplug the power cord before repairing or replacing any internal components of the unit. Before any attempt to replace a component, be sure to check all electrical connections for proper contact. Only a qualified service technician should perform electrical and mechanical adjustments or repairs.

Brewing Problems (continued)			
PROBLEM	POSSIBLE CAUSE	SERVICE CHECK	SOLUTION
Agitation does not automatically start after brew.	<ul style="list-style-type: none"> • Timer faulty. • Air pump faulty. 	<ul style="list-style-type: none"> • Pressing manual agitation button starts air pump. • Pressing manual agitation button does not start air pump. Also check for 120V at electrical input to pump. 	<ul style="list-style-type: none"> • Replace timer. • Replace air pump.
Agitation pump starts, but does not stir coffee.	<ul style="list-style-type: none"> • Silicone tube at top of gauge glass broken. 	<ul style="list-style-type: none"> • Visual. 	<ul style="list-style-type: none"> • Replace tubing.

If you still need help, call Grindmaster-Cecilware Technical Service Department, (502) 425-4776 or (800) 695-4500 (USA & Canada only) (Monday through Friday 8 AM - 6 PM EST). Please have the model and serial number ready so that accurate information can be given.

Prior authorization must be obtained from Grindmaster-Cecilware for all warranty claims.

Grindmaster-Cecilware provides the industry's BEST warranty. Visit our website at gmcw.com for warranty terms and conditions.

Wiring Diagram

All Series Urns with Air Agitation (Does not apply to Pourover Urns)

WIRING DIAGRAM
 FOR 1, 2, OR 3 LINER URNS
 AUTO AGITATION, 1/2 AND FULL BATCH
 PUMP OR HEAT EXCHANGE
 ELECTRIC, STEAM, OR GAS HEAT

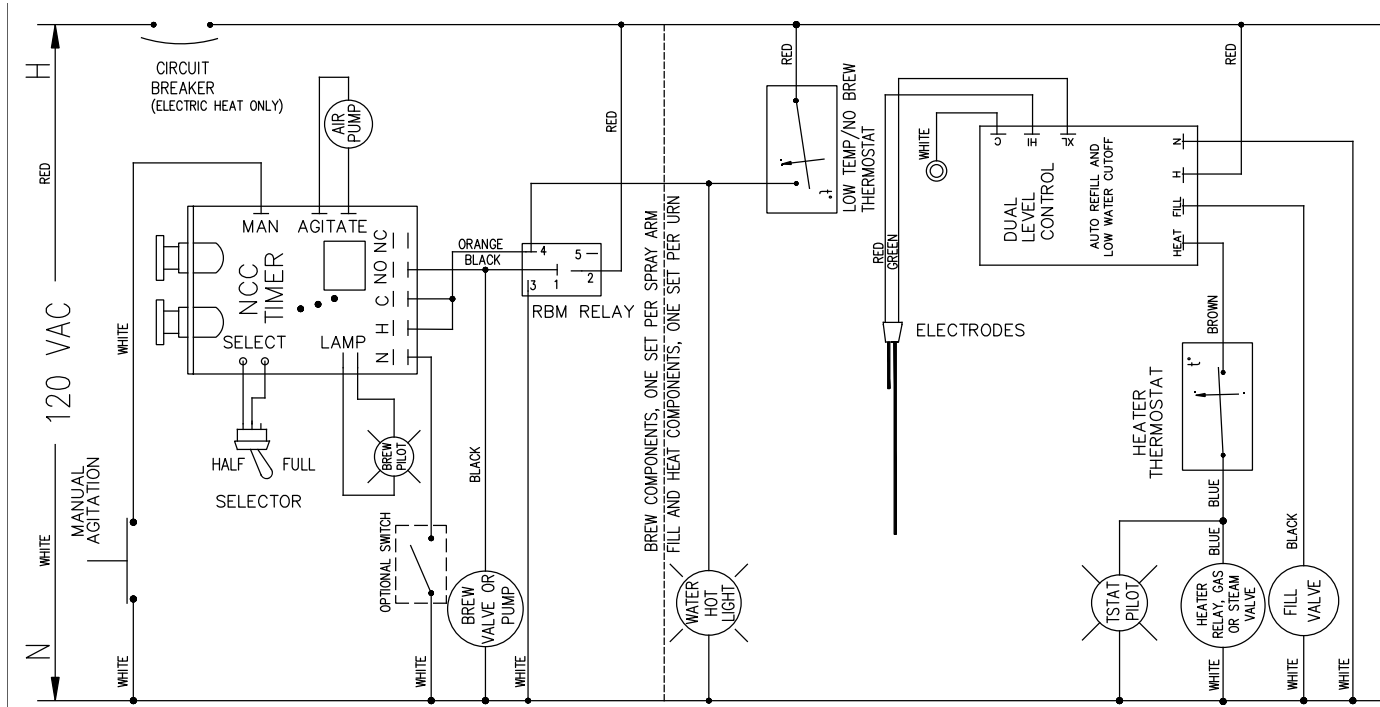

TIMER ADJUSTMENT UNDER
 SNAP PLUG ON CONTROL
 PANEL FACE

NOTES:
 1) STEAM VALVE LEADS ARE BLACK OR RED.

Wiring Diagram (continued)

All Series Urns with Low Temp No Brew (Does not apply to Pourover Urns)

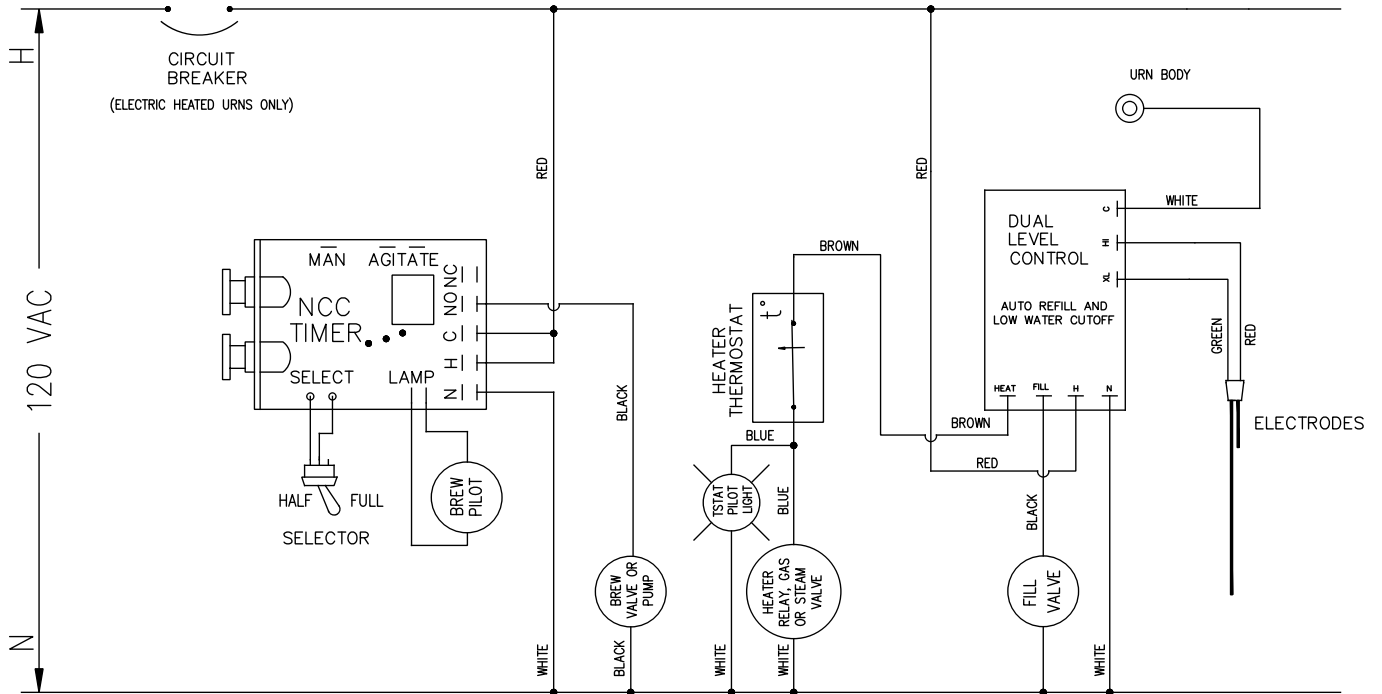

SWITCHING FROM RBM TO 2 POLE RELAY

NOTES:
1) STEAM VALVE LEADS ARE BLACK OR RED.

Wiring Diagram (continued)

All Series Urns with No Air Agitation (Does not apply to Pourover Urns)

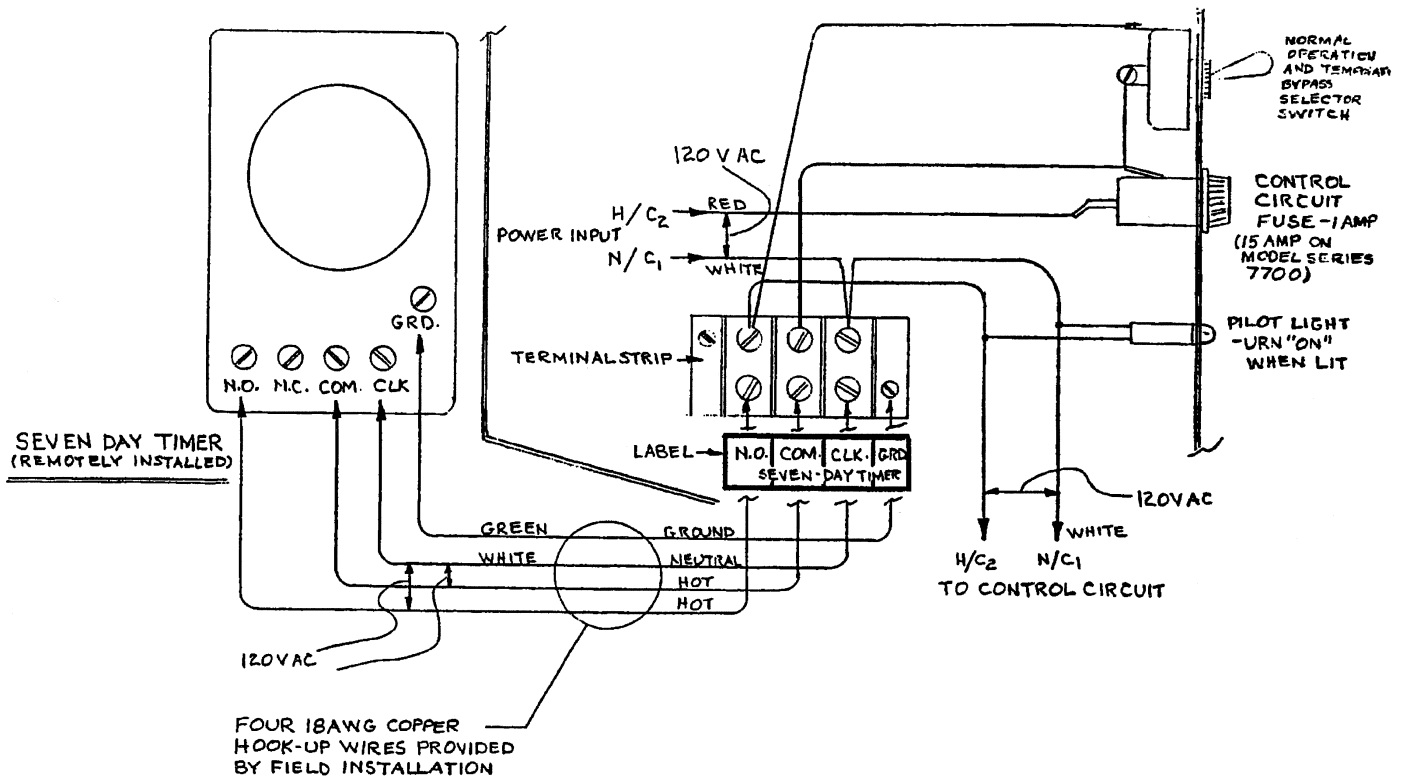

TIMER ADJUSTMENT UNDER
SNAP PLUG ON CONTROL
PANEL FACE

NOTES:

- 1) STEAM VALVE LEADS ARE BLACK OR RED.
- 2) USE THIS DIAGRAM FOR MODELS: 8215, OR CH SERIES, AND OTHER SINGLE OR TWIN URNS WITHOUT AGITATION.

Wiring Diagram (continued)

Optional Seven Day Timer

NOTE: MAY HAVE CIRCUIT BREAKER INSTEAD OF FUSE.

Wiring Diagram (continued)

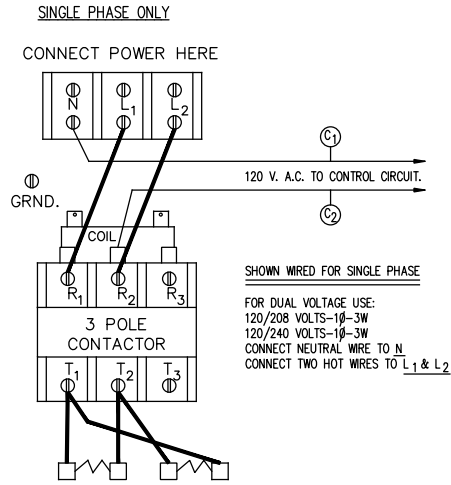

Optional High Speed Fill Jug

Drawing #A-1001

Wiring Diagram (continued)

208V-240V 2 or 3 Heating Element Wiring (All Urns)

2 HEATING ELEMENTS - SINGLE PHASE ONLY
DO NOT WIRE 2 ELEMENTS 3 PHASE
NOTE: A 2 POLE CONTACTOR MAY BE USED ON MODELS
HAVING A LOW WATTAGE HEATER

ELECTRIC SERVICE	STANDARD PARTS
120/208/3Ø/4 WIRE 120/208/1Ø/3 WIRE 120/240/1Ø/3 WIRE	REQUIRES CIRCUIT BREAKER FOR CONTROL CIRCUIT PROTECTION. NEUTRAL TERMINAL BLOCK PROVIDED.
208/1Ø/2 WIRE 240/1Ø/2 WIRE 240/3Ø/3 WIRE 208/3Ø/3 WIRE	NO NEUTRAL TERMINAL BLOCK SUPPLIED. NON PUMP TYPE URNS INCLUDE STEPDOWN TRANSFORMER OR SEPARATE 120V CORD FOR CONTROL CIRCUIT. PUMP TYPE AND REMOTE DISPENSING URNS HAVE SEPARATE 120V CORD FOR CONTROL CIRCUIT.

SINGLE PHASE WIRING SHOWN
TO CONVERT TO THREE PHASE Δ
1) MOVE WIRE ⑥ FROM L₁ TO L₃.
2) MOVE WIRE ④ FROM T₄ TO T₂.

2 HEATING ELEMENTS - SINGLE PHASE ONLY
DO NOT WIRE 2 ELEMENTS 3 PHASE

Wiring Diagram (continued)

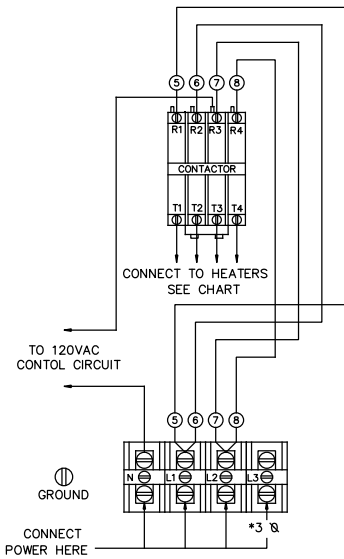

380V-480V 3PH, 3 Element Wiring (All Urns)

NOTE: PUMP URNS AND REMOTE DISPENSING URNS HAVE A SEPARATE CORD AND PLUG FOR CONTROL CIRCUIT.

Wiring Diagram (continued)

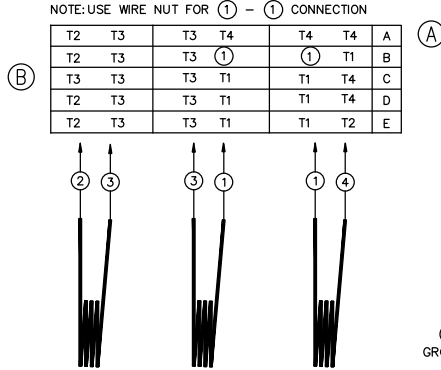

208V-240V Alternate Low Water Heater

120/208V - 1 PH - 3 WIRE
 120/240V - 1 PH - 3 WIRE
 120/208V - 3 PH - 4 WIRE
 (WITH NEUTRAL WIRE)

*** FOR 3 PHASE WIRING**

1. MOVE WIRE (6) FROM L1 TO L3
2. CONNECT HEATER ACCORDING TO FIG. E ON CHART
3. FIG. E FOR 3 PH ONLY

240V HEATERS
