America's Quality Choice in Refrigeration

Part Number STH12 9/10

Manitowoc

Safety Notices

As you work on Manitowoc equipment, be sure to pay close attention to the safety notices in this handbook. Disregarding the notices may lead to serious injury and/or damage to the equipment.

Throughout this handbook, you will see the following types of safety notices:

⚠ Warning

Text in a Warning box alerts you to a potential personal injury situation. Be sure to read the Warning statement before proceeding, and work carefully.

⚠ Caution

Text in a Caution box alerts you to a situation in which you could damage the equipment. Be sure to read the Caution statement before proceeding, and work carefully.

Procedural Notices

As you work on Manitowoc equipment, be sure to read the procedural notices in this handbook. These notices supply helpful information which may assist you as you work.

Throughout this handbook, you will see the following types of procedural notices:

Important

Text in an Important box provides you with information that may help you perform a procedure more efficiently. Disregarding this information will not cause damage or injury, but it may slow you down as you work.

NOTE: Text set off as a Note provides you with simple, but useful, extra information about the procedure you are performing.

Read These Before Proceeding:

⚠ Caution

Proper installation, care and maintenance are essential for maximum performance and trouble-free operation of your Manitowoc equipment. If you encounter problems not covered by this handbook, do not proceed, contact Manitowoc Foodservice Group. We will be happy to provide assistance.

Important

Routine adjustments and maintenance procedures outlined in this handbook are not covered by the warranty.

⚠ Warning

PERSONAL INJURY POTENTIAL

Do not operate equipment that has been misused, abused, neglected, damaged, or altered/modified from that of original manufactured specifications.

We reserve the right to make product improvements at any time. Specifications and design are subject to change without notice.

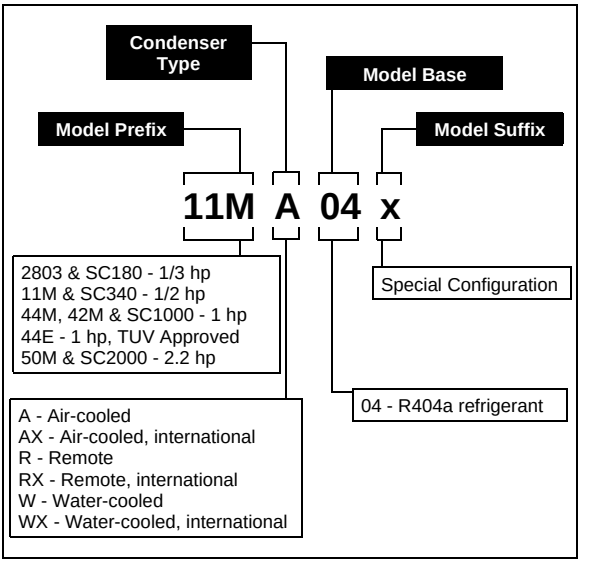
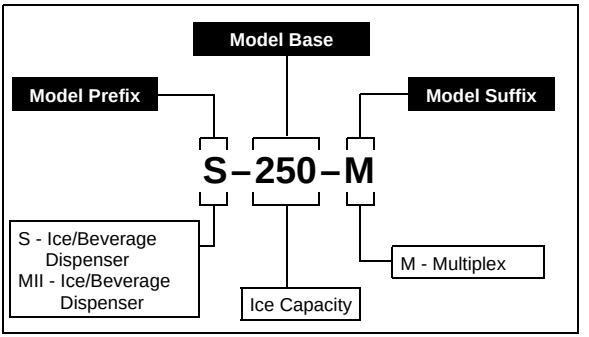
Ice/Beverage Dispensers	
MII-302	S-250M

How to Read a Model Number



ICE/BEVERAGE MODEL NUMBERS



Accessories

Depending on store type and location, various optional equipment (such as CO_2 Panel, water filter kit, water booster kit, etc.) may be added to this system. Install and connect any optional equipment in the desired location according to the installation instructions provided with these kits/equipment.

Special Applications

ATTENTION: MARINE INSTALLATIONS

⚠ Warning

This unit is for use on vessels over 66 ft (20 m) in length. This unit must not be installed in the engine space of a gasoline-powered ship.

NOTE: This unit must be secured to the vessel during installation. Models with part numbers beginning with the letters TS are NOT marine listed.

OUTDOOR APPLICATIONS

TS Multiplex Beverage Recirculating units are approved and listed by Underwriters Laboratories (UL). However they are not UL approved for weather exposure applications. These units must be installed in areas where adequate protection from the elements is provided, all other models are ETL listed.

⚠ Warning

Personal Injury Potential

Do not operate equipment that has been misused, abused, neglected, damaged, or altered/modified from that of original manufactured specifications.

Model/Serial Number Location

These numbers are required when requesting information from your local Manitowoc Distributor, service representative, or Manitowoc Foodservice. The model and serial number are listed on the OWNER WARRANTY REGISTRATION CARD. They are also listed on the MODEL/SERIAL NUMBER DECAL affixed to the unit.

Warranty Information

Consult your local distributor for terms and conditions of your warranty. Your warranty specifically excludes all beverage valve brixing, general adjustments, cleaning, accessories and related servicing.

Your warranty card must be returned to activate the warranty on this equipment. If a warranty card is not returned, the warranty period can begin when the equipment leaves the factory.

No equipment may be returned without a written Return Materials Authorization (RMA). Equipment returned without an RMA will be refused at the dock and returned to the sender at the sender's expense.

Please contact your local distributor for return procedures.

Installation

Pre-installation Checklist

When installing any system, first make sure the major components are available. Generally the major components necessary for an installation are:

B-I-B System also:

- ☐ B-I-B connectors
- ☐ B-I-B regulator set
- ☐ B-I-B rack
- ☐ B-I-B syrup boxes

Bulk Syrup System also:

- ☐ Syrup connectors for Bulk tank
- ☐ Gas connectors for Bulk tank
- ☐ Bulk syrup tanks

Post Mix System:

- [ ] CO_2 regulator set
- [ ] Beverage dispenser
- [ ] Beverage tubing
- [ ] CO_2 tank
- [ ] Carbonator
- [ ] Stepless (Oetiker) clamps
- [ ] Chain for CO_2 tank

Double Check:

- [ ] Do you have enough space to install the dispenser or a dispenser and top mounted cuber?
- [ ] Does top mounted cuber (if utilized) have a minimum of 6 inches (15.3 cm) clearance on all sides?
- [ ] Is the countertop level?
- [ ] Can the countertop support the weight of the dispenser, or the dispenser/cuber combination plus the weight of the stored ice?

Also consider the location of the following items before installation:

- ☐ Water line
- ☐ Drain
- ☐ Power outlet
- ☐ Heating and air conditioning ducts

Top Mounted Ice Maker Installations

- ☐ **Location** — Avoid placing the dispenser and/or ice machine near heat sources such as radiators, ovens, refrigeration equipment and direct sunlight.
- ☐ **Clearances** — Six inch (15.2 cm) clearance on all sides of the icemaker is needed.
- ☐ **Front of icemaker to be flush with front of dispenser** — The front of the icemaker must be flush with the front of the dispenser. When the icemaker is flush with the front of the dispenser, some icemakers may overhang at the back of the dispenser.
- ☐ **Drains** — A separate drain line is required for the ice machine, in addition to a drain line for the ice/beverage dispenser.
- ☐ Dispensers require an adapter kit to install some top-mounted icemakers. Contact your local distributor for the correct adapter kit.

WATER AND SYRUP LINES

This kit facilitates connecting the unit to a 12-16 line conduit, with one or two carbonated water recirculating systems, and one or two plain water supply lines, and maximum 8 syrup product lines.

The unit is shipped with connecting lines terminating under the unit. It will be necessary to make a 90° turn

down through the counter top, to connect to the conduit. It will also be necessary to fully insulate this new added section before passing through the counter top, or before hooking to main conduit.

CARB WATER LINES

- Unit has two carb water lines, one for each flex manifold.
- Use 2 @ 1/2" x 1/2" elbow and 6-12" of 1/2" conduit tubing to make connection bend from unit down through hole in counter top, to mate with conduit.
- Conduit with only two circulating carb water lines.
- Use two @ 1/2" barb U-bend adapters (invert one) to connect the two carb circulating lines from conduit to the two carb water lines from the unit. Use short 1/2" conduit line to connect the two U-bends as shown (item #8).
- Conduit with four, two sets of recirculating carb water lines.
- Use two @ 1/2" barb U-bend adapters, to connect each set of circulating conduit lines to each carb water line from unit as shown (8).

PLAIN WATER LINES

- Unit has two plain water lines, one for each flex manifold.
- Use two @ 3/8" x 1/2" elbows and 6-12" of 1/2" conduit tubing to make connection bend from unit down through hole in counter top, to mate with conduit.
- Conduit with only one plain water line.
- Use one @ 1/2" U-bend adapter, to connect the two plain water lines to one plain water line from conduit (item #3).
- Conduit has two plain water lines.
- Use two @ 1/2" straight adapters to connect each plain water line from unit to each plain water line from conduit as shown (3).

SYRUP LINES

- Unit has eight syrup lines.
- Use seven @ 1/4 x 3/8" and one @ 1/4 x 1/2" elbows and proper size conduit tubing to make connection bend from unit down through hole in counter top, to mate with conduit.
- FULLY INSULATE (no air gaps) and finish with tape wrap, all these connections from unit, through 90° bend connection and down close to straight conduit connection. Locate unit properly on counter, and secure to counter. Finish connections to conduit with 3/8" x 3/8" and 1/2" x 1/2" straight barb connectors, and U-bend adapters, as needed.
- FULLY INSULATE and finish with tape wrap all these connections to the conduit.

Refrigeration Units

- Refrigeration units require stand or 6" (15.2 cm) legs. Refrigeration unit cannot be placed directly on floor.
- Conduit can be run through floor or ceiling chase.
- Syrup supply can be located on stand or adjacent to refrigeration unit.

CLEARANCES

Control Side (Right)	18" (45.7 cm)
Tower Connection Side (Left)	12" (30.5 cm)
Back Side	6" (15.2 cm)
Ceiling	18" (45.7 cm)

REMOTE CONDENSER LINESET REQUIREMENTS

Important

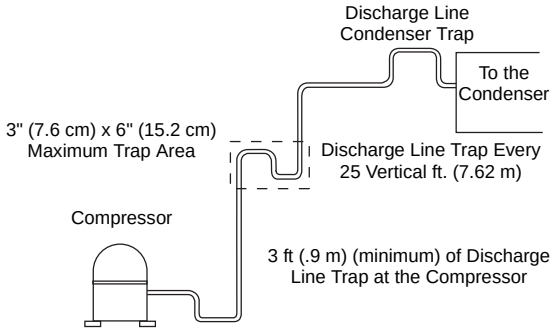
If you have a MAC Multi-Pass condenser please add three (3) pounds additional charge.

Important

If you exceed the 100ft line set length add .72oz/ft of line set run (one way) for every foot over 100ft, to the UNIT charge

1. Both the discharge and liquid remote condensing lines must be kept to a minimum distance for maximum performance. All Multiplex systems are capacity rated to 100 ft (30.5 m) tubing distance between the compressor and condenser. If you have another brand condenser, please add additional charge for the condenser (example: up to three (3) pounds for a MAC condenser).
2. Any vertical rise 25 ft (7.62 m) or greater must have a manufactured or installed trap (bend), in the discharge refrigeration line from the compressor to the remote condenser. A trap is necessary for every additional 25 ft (7.62 m) vertical rise. When excessive vertical rise exists, this trap allows oil to reach the condenser and return to the compressor.

3. The easiest method to create a trap is to bend the tubing (smoothly, no kinks) into the trap form.



4. The trap(s) must be of minimum height of 3" (7.6 cm) and a width of 6" (15.2 cm) to minimize oil accumulation. The traps can also be bent out of the refrigeration tubing. Carefully bend the tubing down 12", and then sweep the tubing back up.
5. It is critical that the remote condensing line size specifications for the specific model be maintained. The specifications are 1/2" discharge and 3/8" liquid lines.

Safe Installation Dos and Don'ts

⚠ Warning

Read the following warnings before beginning an installation. Failure to do so may result in possible death or serious injury.

- Adhere to all National and Local Plumbing and Electrical Safety Codes.
- Turn OFF incoming electrical service switches when servicing, installing, or repairing equipment.
- **DO NOT** throw or drop a CO_2 cylinder. Secure the cylinder(s) in an upright position with a chain.
- **DO NOT** store CO_2 cylinders in temperature above 125°F (51.7°C) near furnaces, radiator or sources of heat.

⚠ Warning

DO NOT connect the CO_2 cylinder(s) directly to the product container. Doing so will result in an explosion causing possible death or injury. It is best to connect the CO_2 cylinder(s) to a regulator(s).

⚠ Warning

Carbon Dioxide (CO_2) displaces oxygen. Exposure to a high concentration of CO_2 gas causes tremors, which are followed rapidly by loss of consciousness and suffocation. If a CO_2 gas leak is suspected, particularly in a small area, immediately ventilate the area before repairing the leak. CO_2 lines and pumps must not be installed in an enclosed space. An enclosed space can be a cooler or small room or closet. This may include convenience stores with glass door self serve coolers. If you suspect CO_2 may build up in an area, venting of the BIB pumps and/or CO_2 monitors must be utilized.

- **DO** check that all flare fittings are tight. This check must be performed with a wrench to ensure a quality seal.
- **DO** inspect pressure on regulators before starting up equipment.
- **DO** protect eyes when working around refrigerants.
- **DO** use caution when handling metal surface edges of all equipment.
- **DO** handle CO_2 cylinders and gauges with care. Secure cylinders properly against abrasion.
- **DO** store CO_2 cylinder(s) in well ventilated areas.
- **DO NOT** exhaust CO_2 gas (example: syrup pump) into an enclosed area, including all types of walk-in coolers, cellars, and closets.
- **DO NOT** release CO_2 gas from old cylinder.
- **DO NOT** touch refrigeration lines inside units; some may exceed temperatures of 200°F (93.3°C).

NOTE: All utility connections and fixtures must be sized, installed, and maintained in accordance with Federal, State, and Local codes.

* Care must be taken when selecting the proper refrigeration unit. Above selections are for 75°F (24°C) conditions, 16 ounce (470 ml) drinks, and average business cycles. Other factors such as lunch or dinner peak periods, large drinks, or high ambient conditions may require the next larger size unit. Contact your Manitowoc Company Authorized Distributor or Manitowoc Beverage Systems (MBS) for more information.

Select a location for the refrigeration unit that meets the requirements of the building plans, local codes, and personnel. The unit must be positioned for free airflow as well as for future service. The following minimum requirements must be met:

- 100 GPH (379 LTR/hr) potable water supply Models 2803/11/38; 200 GPH (757 LTR/hr) potable water supply Models 44/50
- Beverage quality CO_2 gas (bulk or bottled supply) with a minimum 3/8" (.96 cm) line
- One Bag-In-Box (BIB) container of each post mix syrup flavor.

NOTE: Refer to nameplate on side of refrigeration unit for voltage and amperage specifications. Make all electrical connections at the junction box located at the top rear of unit. Optional equipment may require additional power supplies.

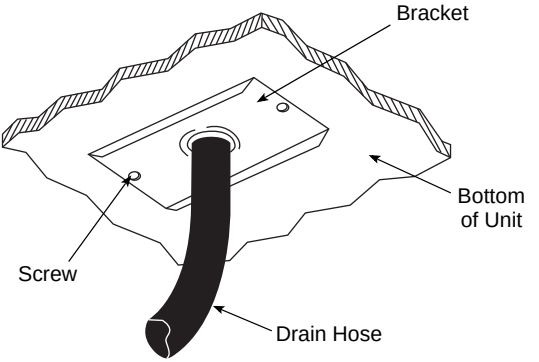
NOTE: Potable water connections to the equipment must comply with local plumbing code requirements, particularly the back-flow prevention requirements.

PLUMBING REQUIREMENTS – GENERAL

Incoming water supply must be provided before installation of the refrigeration unit and must comply with local plumbing requirements.

1. A minimum 1" (2.54 cm) water supply line with a manual shut-off valve must be plumbed at least 6 ft (183 cm) from the unit. The incoming water supply pressure must not exceed 70 psi static (4.8 bar) and be no less than 40 psi (2.8 bar) dynamic. If supply water pressure is greater than 70 psi (5 bar), a water regulator will be required.
2. Locate the drain hose, bracket, and two screws provided in the installation kit. Attach the drain hose to the water bath overflow tube located on the bottom of the refrigeration unit.

3. Connect the water manifold supply line, located on the bulkhead panel in the motor compartment to the main water supply. The main water supply shut-off valve must remain in the OFF position. If a water filter is to be installed, connect the line to the outlet fitting of the filter. Plumb according to applicable plumbing codes.



Drain Hose Connection

4. When a water cooled condenser is installed, a copper supply line (not supplied with unit) must be plumbed to the 3/8" (.965 cm) male flare fitting installed in the water shut-off assembly. The shut-off must be placed in the OFF position. A copper drain line (not supplied) is to be connected to the outlet fitting of the water cooled condenser and routed to the floor drain.

WATER SUPPLY

1. Use the built in fill valve that is already plumbed into the unit.
2. An appropriate floor drain is required within 6 ft (2 m) of the unit.
3. Potable water connections to the equipment must comply with the basic plumbing code of the Building Officials and Code Administrators International, Inc. (BOCA) and the Food Service Sanitation Manual of the Food and Drug Administration. Verify local plumbing code requirements.

Electrical

GENERAL

⚠ Warning

All wiring must conform to local, state and national codes.

MINIMUM CIRCUIT AMPACITY

The minimum circuit ampacity is used to help select the wire size of the electrical supply. (Minimum circuit ampacity is not the unit's running amp load.) The wire size (or gauge) is also dependent upon location, materials used, length of run, etc., so it must be determined by a qualified electrician.

ELECTRICAL REQUIREMENTS

Refer to unit's Model/Serial Plate for voltage/amperage specifications.

SPECIFICATIONS

Model	Volt/Cycle/Phase	Minimum Circuit Amps	Breaker	Compressor
2803 & SC180	120/60/1 230/50/1	20.3 9.0	25A 16A	1/3 hp .46 kW

50M	120* /208-230/60/3 230/400/50/3	25.2 11.6	30A 20A	2.2 hp 2.0 kW
SC2000	208-230/60/3 230/400/50/3	25.2 11.6	20A 15A	2.2 hp 2.0 kW

* Only the model 50M with SS part numbers have 120V components, the TS does not.

GROUNDING INSTRUCTIONS

⚠ Warning

The unit must be grounded in accordance with national and local electrical codes.

This appliance must be grounded. In the event of malfunction or breakdown, grounding provides a path of least resistance for electric current to reduce the risk of electric shock.

NOTE: The refrigeration units are not equipped with a cord.

⚠ Warning

Improper connection of the equipment-grounding conductor can result in a risk of electric shock. The conductor with insulation having an outer surface that is green with or without yellow stripes is the equipment grounding conductor. If repair or replacement of the cord or plug is necessary, do not connect the equipment-grounding conductor to a live terminal. Check with a qualified electrician or serviceman if the grounding instructions are not completely understood, or if in doubt as to whether the appliance is properly grounded. Do not modify the plug provided with the appliance — if it will not fit the outlet, have a proper outlet installed by a qualified electrician.

⚠ Warning

When using electric appliances, basic precautions must always be followed, including the following:

a. Read all the instructions before using the appliance.

b. To reduce the risk of injury, close supervision is necessary when an appliance is used near children.

c. Do not contact moving parts.

d. Only use attachments recommended or sold by the manufacturer.

e. Do not use outdoors.

f. For a cord-connected appliance, the following shall be included:

- Do not unplug by pulling on cord. To unplug, grasp the plug, not the cord.
- Unplug from outlet when not in use and before servicing or cleaning.
- Do not operate any appliance with a damaged cord or plug, or after the appliance malfunctions or is dropped or damaged in any manner. Contact the nearest authorized service facility for examination, repair, or electrical or mechanical adjustment.

g. For a permanently connected appliance — Turn the power switch to the off position when the appliance is not in use and before servicing or cleaning.

h. For an appliance with a replaceable lamp — Always unplug before replacing the lamp. Replace the bulb with the same type.

i. For a grounded appliance — Connect to a properly grounded outlet only. See Grounding Instructions.

44M, 42M & SC1000	40 – 70 psig (2.8 – 4.9 bar)	3/4" ID within 6 ft (2 m)	1/2" ID EVA Line
50M	40 – 70 psig (2.8 – 4.9 bar)	3/4" ID within 6 ft (2 m)	1/2" ID EVA Line
SC2000	40 – 70 psig (2.8 – 4.9 bar)	3/4" ID within 6 ft (2 m)	1/2" ID EVA Line

A 1" (2.54 cm) ID copper inlet water line equipped with a 3/4" (1.905 cm) FPT adapter with shut-off must be supplied by plumber at rear of equipment. Appropriate floor drains must be provided within 6 ft (183 cm) of each unit installed.

NOTE: The carbonator in this unit is provided with a dual check valve type back-flow preventer, which conforms to ASSE 1032. The Model 50M & 44M vented backflow preventer conforms to ASSE 1022.

Potable water connections to the equipment must comply with the basic plumbing code of the Building Officials and Code Administrators International, Inc. (BOCA) and the Food Service Sanitation Manual of the Food and Drug Administration. Verify local plumbing code requirements.

Preparing Ice Bank – Non-ERC

BUILDING AN ICE BANK

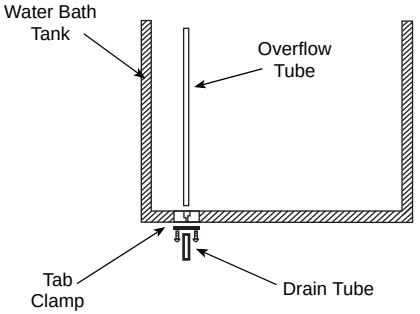
1. At this time, fill the unit water bath tank to the top, or within 1/2" (1.3 cm) of the top minimum, of the overflow tube. Use a garden hose or another water supply to do this.

NOTE: A manual fill valve is incorporated into the water circuit to the carbonator tank. This valve can be used to manually add water lost for any reason. Do not leave this valve ON constantly, only use it for filling and topping off. The water bath must be drained, flushed, and refilled every six months.

2. Turn ON the switch labeled “Refrigeration”. Allow unit to run for about 15 minutes before proceeding to step 3.
3. Turn ON the switch labeled “Agitator”.

NOTE: Turn this switch OFF to perform any operations in the water bath area.

With water bath water temperature of 65°F (18°C), ice will begin to form on the evaporator coils in approximately 2 hours. The unit will build a full ice bank in approximately 4 to 6 hours (depending on ambient water temperature).



4. Before turning on the carbonator or circulator switch, verify that the pump box assembly has been mounted and connected to the unit and the appropriate syrup and water has been supplied.

5. Turn on the main water supply to the booster assembly. Verify the booster is plugged in and that the accumulator tank valve is open. (If the system has an optional “Out-of-Syrup” device, verify that it is unplugged.)
6. Verify the pump is running. Place the valve on the right side of the pump box in the purge position until all air bubbles have passed through the line. Turn the valve back to “dispense”. Plug the Out-of-Syrup device power cord into an appropriate wall outlet at this time (if supplied).

NOTE: Verify that the pump box holding tank is full before proceeding.

7. Turn on the circulator and carbonator switches. The carbonator must run for approximately 1 to 3 minutes and shut off. The circulator must run continuously. Verify that water is returning to the water bath through the return bulk head fitting.

Important

Wait until a thin layer of ice has begun to form on the evaporator before proceeding any further.

8. Go to the tower(s) and brix the valves. Using a syrup separator and volume cup, adjust the flow rate of the carbonated water to two fluid ounces per second. Then, using the separator and a brix cup, adjust the syrup flow rate for a ratio of carbonated water to syrup.

Preparing Ice Bank with ERC

BUILDING AN ICE BANK

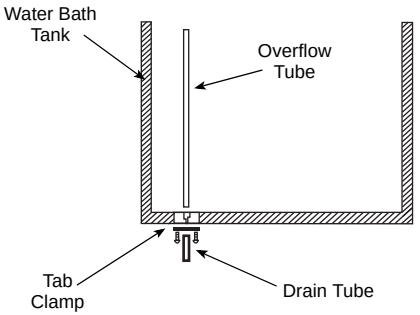
1. At this time, fill the unit water bath tank to the top, or within 1/2" (1.3 cm) of the top minimum, of the overflow tube. Use a garden hose or another water supply to do this.

NOTE: A manual fill valve is incorporated into the water circuit to the carbonator tank. This valve can be used to manually add water lost for any reason. Do not leave this valve ON constantly, only use it for filling and topping off. The water bath must be drained, flushed, and refilled every six months.

2. Main power to unit must be on. Power delay of 30 seconds occurs when power applied. “Pd30”
3. Press COMP/AGIT switch on keypad display.
4. Agitator will come on immediately and compressor delay will start. “Cd99” will count from 180 to 0.

NOTE: Turn this switch OFF to perform any operations in the water bath area.

With water bath water temperature of 65°F (18°C), ice will begin to form on the evaporator coils in approximately 2 hours. The unit will build a full ice bank in approximately 4 to 6 hours (depending on ambient water temperature).



5. Turn on the main water supply to the booster assembly. Verify the booster is plugged in and that the accumulator tank valve is open. (If the system has an optional “Out-of-Syrup” device, verify that it is unplugged.)
6. Verify the pump is running. Place the valve on the right side of the pump box in the purge position until all air bubbles have passed through the line. Turn the valve back to “dispense”. Plug the Out-of-Syrup device power cord into an appropriate wall outlet at this time (if supplied).

NOTE: Verify that the pump box holding tank is full before proceeding.

7. Turn on the circulator and carbonator. The carbonator must run for approximately 1 to 3 minutes and shut off. The circulator must run continuously. Verify that water is returning to the water bath through the return bulk head fitting.

Important

Wait until a thin layer of ice has begun to form on the evaporator before proceeding any further.

8. Go to the tower(s) and brix the valves. Using a syrup separator and volume cup, adjust the flow rate of the carbonated water to two fluid ounces per second. Then, using the separator and a brix cup, adjust the syrup flow rate for a ratio of carbonated water to syrup to 5 to 1.

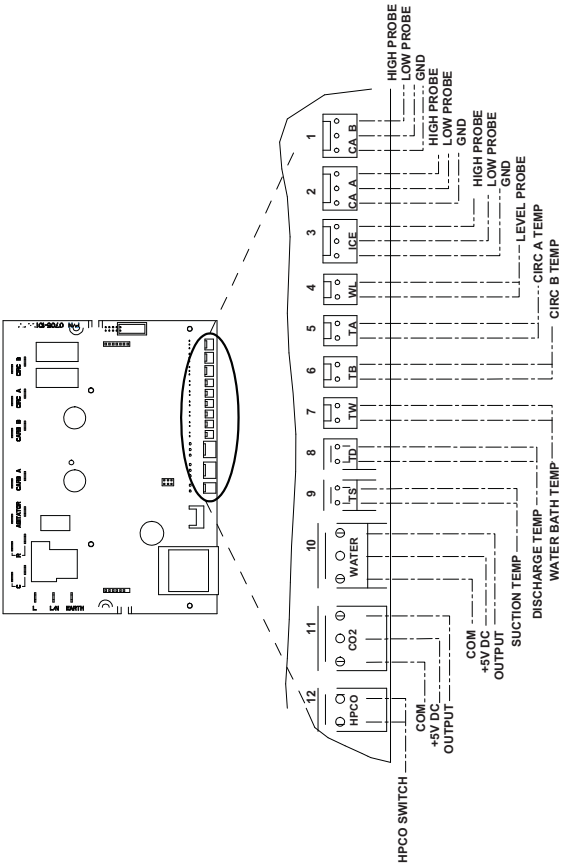
ERC CONTROL BOARD INPUT CONNENCTIONS



Maintenance Schedule

This section provides a list of periodic maintenance tasks and the scheduled frequency required to ensure the proper operation of your Multiplex dispensing equipment. To ensure quality beverages, prevent downtime, and reduce costs, these tasks must be performed as indicated.

PERIODIC MAINTENANCE FOR SOFT DRINK EQUIPMENT (LISTED BY MAJOR COMPONENTS)

Dispensing stations

Daily (365 times per year)

- Take temperature of finished drinks. Pour off the first and take the temperature of the second drink. The proper temperature of drinks must be 38°F (4°C) or less.
- Remove nozzles and diffusers from each dispensing valve. Clean with soap and warm water (not hot). Rinse with carbonated water and reinstall.
- Flush all dispenser drains. Pour hot water down drains at closing.

Beverage conduits

Every 4 months (3 times per year)

- Inspect beverage conduits for damage. Re-insulate and seal any uninsulated areas.
- Inspect floor chases and seal any open chase ends.

Air compressor

Monthly (12 times per year)

- Drain condensate water from air compressor tank.

Every 4 months (3 times per year)

- Inspect air compressor filter and replace if clogged. Air filter must be replaced every 6 months.

- Inspect air compressor to verify cut-in at 70 psi (4.8 bar) and cut-out at 90 psi (6.3 bar). Adjust pressure switch if necessary.
- Inspect system for air leaks and repair as required.

Refrigeration unit

Every 4 months (3 times per year)

- Clean the refrigeration unit air-cooled condenser using a vacuum cleaner. If equipped with water-cooled condenser, verify the water discharge temperature is at 105°F (41°C). Adjust water modulating valve if necessary.
- Inspect water bath to verify water level is at the top of stand pipe. If below, add water and repair water makeup device. If excessive amount of water is flowing over stand pipe, locate leak within bath and repair.
- Inspect ice bank within the water bath to verify proper size ice bank and clarity. Look for uniform, 2" to 4" thick ice bank.
- Drain, clean, and refill water bath.
- Inspect agitator motor and ensure proper operation.
- Inspect the circulating motor/pump assembly. Clean strainer and oil motor.
- Inspect the carbonating motor/pump assembly. Clean strainer and oil motor.
- Inspect entire system for leaks and repair as required.

Water filters

Every 4 months (3 times per year)

- Verify that incoming water pressure is not less than 40 psi (2.8 bar) or greater than 60 psi (4.1 bar). If equipped with a water regulator, verify proper setting of 55 psi (3.8 bar). Adjust if necessary.
- If pressure is low, inspect water filter cartridges to ensure they are able to supply adequate water pressure under normal system flow. Replace if unable to provide minimum 20 psi (1.4 bar) under load.

Syrup supply

Daily (365 times per year)

- Clean general area of syrup hookup with soap and warm water. Rinse off all soap.

Every 4 months (3 times per year)

- Inspect syrup lines for proper flavor identification labels. Replace labels if necessary.
- Disconnect syrup containers. Clean connector with soap and warm water. Rinse with plain water and reconnect to syrup containers.

CO_2 gas supply

Every 4 months (3 times per year)

- Inspect pressure setting at CO_2 high pressure regulator. Verify proper 90 psi (6.3 bar) pressure setting. Adjust if necessary.
- Inspect pressure setting at syrup pressure regulators. Verify propter pressure setting. Adjust if necessary.
- Inspect system for CO_2 leaks, repair as required.

PERIODIC MAINTENANCE FOR SOFT DRINK EQUIPMENT (LISTED BY SCHEDULED FREQUENCY)

Daily (365 times per year)

- Take temperature of finished drinks. Pour off the first and take the temperature of the second drink. The proper temperature of drinks must be 38°F (4°C) or less.
- Remove nozzles and diffusers from each dispensing valve. Clean with soap and warm water (not hot). Rinse with carbonated water and reinstall.
- Flush all dispenser drains. Pour hot water down drains at closing.
- Clean general area of syrup hookup with soap and warm water. Rinse off all soap.

Every 4 months (3 times per year)

- Using Brix cup and syrup separator, check for proper carbonated water flows (standard flow: 5 oz. in 4 seconds, fast flow: 10 oz. in 4 seconds)

and syrup to water ratios at each dispensing station. Adjust as required.

- Inspect beverage conduits for damage. Re-insulate and seal any uninsulated areas.
- Inspect floor chases and seal any open chase ends.
- Inspect air compressor filter and replace if clogged. Air filter must be replaced every 6 months.
- Inspect air compressor to verify cut-in at 70 psi (4.8 bar) and cut-out at 90 psi (6.3 bar). Adjust pressure switch if necessary.
- Inspect system for air leaks and repair as required.
- Clean the refrigeration unit air-cooled condenser using a vacuum cleaner. If equipped with water-cooled condenser, verify the water discharge temperature is at 105°F (41°C). Adjust water modulating valve if necessary.
- Inspect water bath to verify water level is at the top of stand pipe. If below, add water and repair water makeup device. If excessive amount of water is flowing over stand pipe, locate leak within bath and repair.
- Inspect ice bank within the water bath to verify proper size ice bank and clarity. Look for uniform, 2" to 4" thick ice bank.
- Drain, clean, and refill water bath.
- Inspect agitator motor and ensure proper operation.
- Inspect the circulating motor/pump assembly. Clean strainer and oil motor.
- Inspect the carbonating motor/pump assembly. Clean strainer and oil motor.
- Inspect entire system for leaks and repair as required.
- Verify that incoming water pressure is not less than 40 psi (2.8 bar) or greater than 60 psi (4.1 bar). If equipped with a water regulator, verify proper setting of 55 psi (3.8 bar). Adjust if necessary.

- If pressure is low, inspect water filter cartridges to ensure they are able to supply adequate water pressure under normal system flow. Replace if unable to provide minimum 40 psi (1.4 bar) under load.
- Inspect syrup lines for proper flavor identification labels. Replace labels if necessary.
- Disconnect syrup containers. Clean connector with soap and warm water. Rinse with plain water and reconnect to syrup containers.
- Inspect pressure setting at CO_2 high pressure regulator. Verify proper 90 psi (6.3 bar) pressure setting. Adjust if necessary.
- Inspect pressure setting at syrup pressure regulators. Verify propter pressure setting. Adjust if necessary.
- Inspect system for CO_2 leaks. Repair as required.

Cleaning and Sanitizing the Dispensing Valves and Product Lines

MAINTENANCE SCHEDULE

Every day	
Dispensing valves	Remove nozzles and diffusers and soak in mild detergent cleaning solution. Scrub parts with small bristle brush taking care to clean small crevices and O-ring grooves. Turn OFF power to dispensing valves. Scrub exterior surfaces, including bottom splash area and actuator lever, with cleaning solution. Reassemble diffusers and nozzles. Wipe dry exterior surfaces before turning ON power.
Drip pan and drain hose	Wash with mild detergent. Rinse with clean water.
Quick disconnects	Wash with mild detergent. Rinse with potable water.
Weekly	
Outside, dispenser cabinet	Wash with clean water and mild detergent. Wipe dry.
Every 3 months	
Syrup circuits	Sanitize each syrup circuit. See “Cleaning and Sanitizing Procedure”.
Water bath	Drain, melt ice and clean using detergent and brush; rinse with potable water. Do not use water over 140°F (60°C).
Every 6 months	
Condenser	Vacuum fins or use soft bristle brush (scrub brush).
Air purifier filter (if equipped)	Replace.

CLEANING EQUIPMENT AND SUPPLIES

- **Recommended cleaner:** Any caustic-base (low sudsing, non-perfumed, easily rinsed) detergent solution which provides a minimum 2% sodium hydroxide. The solution must be prepared in accordance with the manufacturer's instructions. Solution temperature must be between 90°F (32°C) and 110°F (43°C). Temperatures in excess of this can cause internal damage to the dispensing valve components.
- **Recommended sanitizer:** Any sanitizer which provides a minimum of 120 parts per million (120 milligrams per liter) of available chlorine. Solution temperature must be between 90°F (32°C) and 110°F (43°C). Temperatures in excess of this can cause internal damage to the dispensing valve components.
- **Two five gallon (figals) syrup tanks** and fittings, cleaned and sanitized (one for cleaner; one for sanitizer)
- **Containers** for cleaner and sanitizer solutions
- **Clean, non-abrasive cloths**
- **Buckets**
- **Small Brush**
- **Extra Nozzles**
- **Extra Jumpers**

CLEANING AND SANITIZING PROCEDURE

NOTE: Cleaning and sanitizing is not required for potable water circuits. Potable water lines must remain connected and operational during the cleaning and sanitizing procedures for syrup circuits.

> **⚠ Caution**
>
> It is **required** that the Carbonated Water Lines remain connected and operational during cleaning and sanitizing of the syrup circuits. Sanitizing of the valve without the Carbonated Water side operation may leave bacteria in the nozzle, diffuser, and syrup tube.

Cleaning and dispensing valves

1. Disconnect each syrup container from its product line. Remove product from the lines by purging with clean warm tap water until syrup has been fully purged from the product lines and valves.
2. Clean all lines and fittings with cleaning solution and rinse with clean, room temperature water to remove all traces of residual product.

Cleaning the product lines

1. To clean each valve product line, attach the valve product lines to the pressure tank containing the cleaning solution. Make sure each line is completely filled. Pressurize the lines by pulsing the valves.

   Pressurizing the product lines

   A. For 15 seconds turn dispensing valve ON, OFF, and then immediately ON again for 15 cycles.

   B. Allow the valve to remain flowing for 3 minutes.

   C. Repeat pulsing and flowing the valves again until all cleaning solution has been used.

> **⚠ Caution**
>
> **Do not** allow cleaning and sanitizing solutions to remain in syrup systems longer than recommended contact time. Exceeding contact time will result in damage to valve components.

2. Flush the cleaning solution from the lines with clean water after a minimum of 3 minutes, by pulsing the valves as described above.
3. Remove the nozzles and the diffuser assemblies from the valves. Clean with cleaning solution. Agitate the assemblies to ensure assemblies are clean. Place them in a container of sanitizing solution for 15 minutes. Wearing sanitary gloves, remove the nozzles and diffuser assemblies from the sanitizing solution. Drain each until dry and reassemble to the valves.
4. Attach each valve product line to the pressure tank containing the sanitizing solution. Be sure all connections are cleaned and sanitized before connecting to each product line.
5. Pressurize and fill the lines with sanitizing solution. Make sure lines are completely filled, Allow the sanitizing solution to flow through each valve while activating the valves for 15 cycles.
   A. Leave valves OFF and allow to stand pressurized for 30 minutes.
   B. Activate the valves for two (2) cycles. Flush remaining sanitizer continuously through the valves.
6. Reconnect the syrup containers to their respective circuits. Prepare the unit for operation.
7. Draw drinks to refill lines and flush the sanitizing solution from the dispenser. Taste the beverage to verify that there is no off-taste (chlorine).

Sanitizing

BEVERAGE SYSTEM CLEANING

⚠ Warning

Flush sanitizing solution from syrup system.

Residual sanitizing solution left in system could create a health hazard.

⚠ Warning

When using cleaning fluids or chemicals, rubber gloves and eye protection must be worn.

Sanitize the beverage system at initial start-up as well as regularly scheduled cleaning. The drain pan must be in place under soda valves, to carry away detergent and sanitizing agents that will be flushed through valves.

BAG-IN-BOX SYSTEM SANITATION

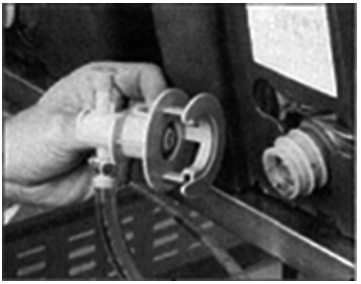
The procedure below is for the sanitation of one syrup circuit at a time. Repeat to sanitize additional circuits.

You will need the following items to clean and sanitize the Bag-in-Box (BIB) beverage system:

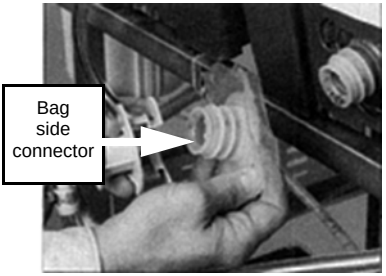
- Three (3) clean buckets
- Plastic brush or soft cloth
- Mild detergent
- Unscented bleach (5% Na CL O) or Commercial sanitizer
- Bag-In-Box bag connector

1. Prepare the following in the buckets:
   - Bucket 1 — warm to hot tap water for rinsing.
   - Bucket 2 — mild detergent and warm to hot water.

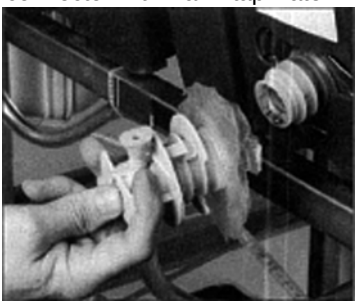
- Bucket 3 — mix a solution of unscented bleach (5% Na CL O) or commercial sanitizer and warm to hot water. Mixture should supply 100 PPM available chlorine (1/4 oz. bleach to 1 gallon water).



2. Disconnect the “syrup-line side” of the BIB connector.



3. Rinse connector with warm tap water.



4. Connect syrup connector to BIB connector and immerse both into Bucket 1. A “bag-side” connector can be created by cutting the connector from an empty disposable syrup bag.
5. Draw rinse water through system until clean water is dispensed. Most beverage valves allow the syrup side to be manually activated by depressing the syrup pallet.
6. Connect Bucket 2 to system.
7. Draw detergent solution through system until solution is dispensed.
8. Repeat steps 2-7 until all syrup circuits contain detergent solution.
9. Allow detergent solution to remain in the system for 5 minutes.
10. Connect Bucket 3 to system.
11. Draw sanitizing solution through system until solution is dispensed.
12. Repeat step 11 until all syrup circuits contain sanitizer solution.
13. Allow sanitizer solution to remain in system for 15 minutes.
14. Remove nozzles and diffusers from beverage valves.
15. Scrub nozzles, diffusers and all removable valve parts (except electrical parts) with a plastic brush or a soft cloth and the detergent solution.
16. Soak nozzles, diffusers and removable valve parts (except electrical parts) in sanitizer for 15 minutes.
17. Replace nozzles, diffusers and valve parts.
18. Connect Bucket 1 to system.
19. Draw rinse water through system until no presence of sanitizer is detected.
20. Attach syrup connectors to BIBs.
21. Draw syrup through system until only syrup is dispensed.
22. Discard first 2 drinks.

FIGAL BEVERAGE SYSTEM

1. Prepare the following in three clean Figal tanks:
   - **Rinse tank** - fill with room temperature tap water.
   - **Detergent tank** - mix approved beverage system cleaner with warm water as directed.
   - **Sanitizing tank** - mix a solution of unscented bleach (5% Na CL O) or commercial sanitizer and warm to hot water. Mixture should supply 100 PPM available chlorine (1/4 oz. bleach to 1 gallon water).
2. Disconnect all product and water lines from product tanks and remove carbonator.
3. Locate the Figal syrup tank for the circuit to be sanitized. Remove both quick disconnects from the Figal syrup tank. Rinse quick disconnects in tap water.
4. Connect rinse tank to the syrup line. Draw clean rinse water through the valve until syrup is flushed from the system.
5. Connect detergent tank to the syrup line and draw detergent through the valve for two minutes. Then, allow remaining detergent to stay in the system for five minutes.
6. Connect rinse tank to the syrup line. Draw clean rinse water through the valve until detergent is flushed from the system.
7. Remove valve nozzle and diffuser as shown in Daily Cleaning instructions. Using a plastic brush or a soft cloth and warm water, scrub the nozzle, diffuser, bottom of the dispensing valve and cup lever, if applicable.
8. Place removable valve parts (EXCEPT solenoids) in sanitizing solution for 15 minutes.
9. Replace valve diffuser and nozzle on the beverage valve.
10. Connect sanitizer tank to the syrup line and draw sanitizer through the valve for two minutes. Allow sanitizer to remain in the system for a minimum of 15 minutes.

11. Reconnect syrup and carbonated water lines.
12. Draw syrup through the lines to rinse the system. Discard drinks until at least two cups of satisfactory tasting beverage are dispensed through the valve.

Shipping, Storage and Relocation

⚠ Caution

Before shipping, storing, or relocating this unit, syrup systems must be sanitized. After sanitizing, all liquids (sanitizing solution and water) must be purged from the unit. A freezing environment causes residual sanitizing solution or water remaining inside the unit to freeze, resulting in damage to internal components.

Operation

How the Multiplex Works

Model 2803 — a 1/3 HP refrigeration unit that will provide pre-mix carbonated beverages and chilled carbonated water for up to 6 gal (3 L) of syrup/day or 280 drinks/day (2,000 gal/yr) with a 40 ft (12 m) maximum conduit length. This is a remote refrigeration unit that derives its peak draw capacity from the reserve ice bank produced from a capillary tube refrigeration system. This system is controlled to cycle ON and OFF by the operation of the ice bank control. The sensing bulb that controls the ice bank is located on an adjustable bracket in the water bath.

Model 11M — a 1/2 HP refrigeration unit that will provide premix carbonated beverages and chilled carbonated water for up to 12 gal (45 L) of syrup/day or 560 drinks/day (4,000 gal/year) with a 100 ft (30 m) maximum conduit length. This is a remote refrigeration unit that derives its peak draw capacity from the reserve ice bank produced from a capillary tube refrigeration system. This system is controlled to cycle ON and OFF by the operation of the ice bank control. The sensing bulb that controls the ice bank is located on an adjustable bracket in the water bath.

Model 42M — a 1 HP refrigeration unit that will provide pre-mix carbonated beverages and chilled carbonated water for up to 50 gal (190 L) of syrup/day or 3,060 drinks/day (18,200 gal/yr) with a 250 ft (80 m) maximum conduit length. This refrigeration unit is a remote refrigeration unit that derives its peak capacity from the reserve ice bank produced from a TXV system. This system is controlled to cycle ON and OFF by the operation of the ice control. The sensing probe that controls the ice bank, is located on an adjustable bracket in the water bath.

Model 44M — a 1 HP refrigeration unit that will provide pre-mix carbonated beverages and chilled carbonated water for up to 50 gal (190 L) of syrup/day or 3,060 drinks/day (18,200 gal/yr) with a 250 ft (80 m) maximum conduit length. This refrigeration unit is a remote refrigeration unit that derives its peak capacity from the reserve ice bank produced from a TXV system. This system is controlled to cycle ON and OFF by the operation of the ice control. The sensing probe that controls the ice bank, is located on an adjustable bracket in the water bath.

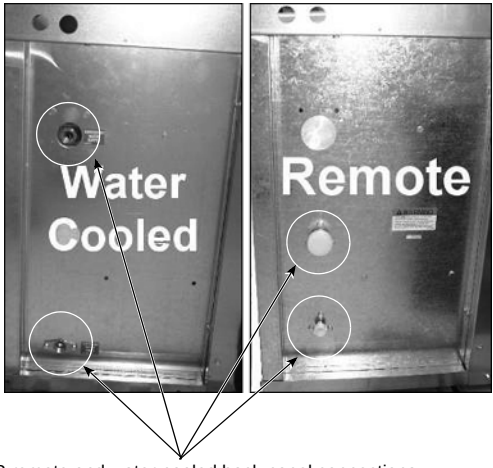
Model 50M — a 2.2 HP Pre-mix refrigeration unit that will provide pre-mix carbonated beverages and chilled carbonated water for up to 42 gal (159 L) of syrup/day or 2,000 drinks/day (15,000 gal/yr) with a 350 ft (107 m) maximum conduit length. This refrigeration unit is a remote refrigeration unit that derives its peak capacity from the reserve ice bank produced by the operation of the compressor. This system is controlled to cycle ON and OFF by the operation of the ice bank control. The sensing bulb that controls the ice bank is located on an adjustable bracket in the water bath.

Differences Between the TS & SS Units

Multiplex soda and water chillers may have three different series numbers. Starting in 2007 some no longer begin with an “SS”; they now begin with a “TS”. Starting in 2008, units with ERC (Electronic Refrigeration Controls) end with an “E”. The following shows you how to tell the difference between the TS version and the SS.

- The TS uses common components from Manitowoc Ice makers to assist in product and parts availability.

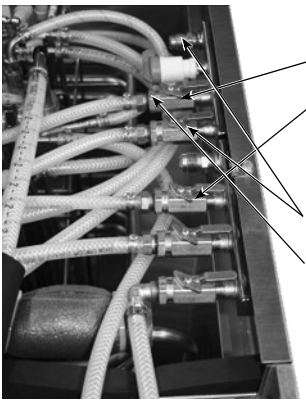
- The TS compressor is mounted with bolts instead of studs.



- TS remote and water-cooled back panel connections are offset to protect fittings.

- TS air-cooled condenser comes standard with a filter.

WATER MANIFOLD TS



Two Stainless Steel log style manifolds

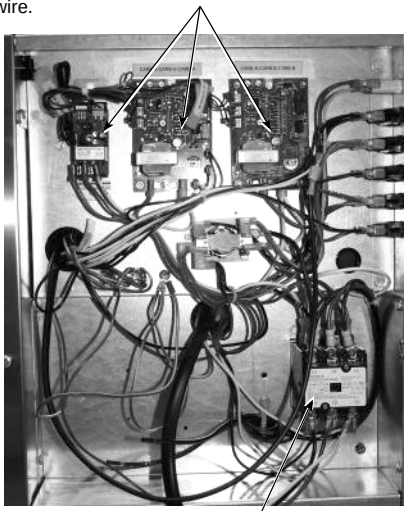
- One regulated supply for carbonator pumps.
- One unregulated supply for non-carb drinks and water bath fill.

Other Connections

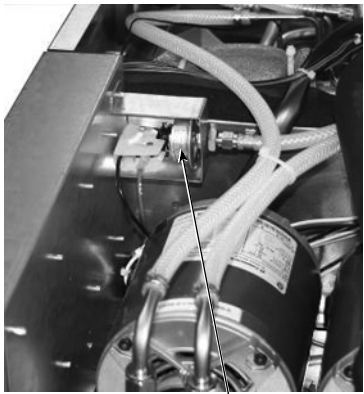
- Connections are made in the water bath compartment.
- Separate plain water manifold eliminates need to plug off during installation.

ELECTRICAL TS

- Electrical compartment has been moved up on the unit to eliminate water intrusion potential from the pump compartment.
- All components are now 208/230V. This eliminates the need for a neutral wire.



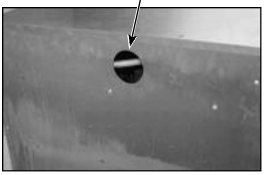
- New unit has service connections in the electrical compartment. Allows more room to work and more reliable connection.

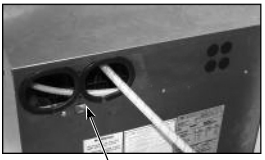


- Pump protection switch has been moved to the pump compartment to eliminate potential leak point in electrical compartment.

WATER BATH ACCESS SS

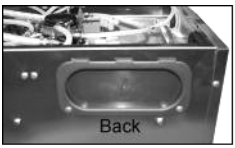
- Has a round hole in the front and back panels with no edge trim to protect lines.





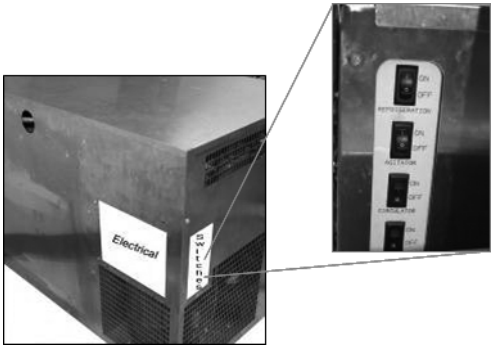
- End panel has two ovals in the rear of the panel with edge trim to help protect conduit lines.

WATER BATH ACCESS TS



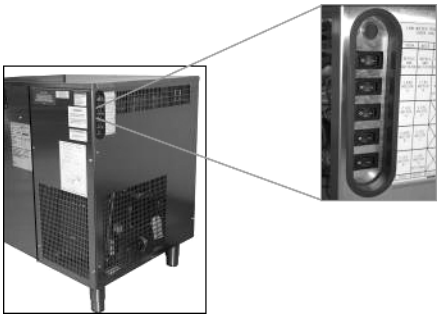
- All panels have large oval access holes with interchangeable covers.
- Front panel has 3 hole cover for water and CO_2 line routing.
- Back panel has solid cover.
- End panel has one open cover and one solid cover.
- Open cover provides wide ledge for conduit line protection.

SERVICE ACCESS SS



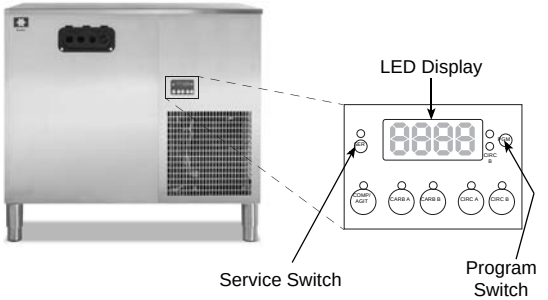
- Front panel was solid and did not allow easy access for service.
- Switch panel was mounted flush to end panel.

SERVICE ACCESS TS



- Front panel is split to allow front access to the compressor compartment.
- Switches are recessed and the edge has trim panel to protect fingers from sheet metal edges.

SERVICE ACCESS TS WITH ERC



- Service Switch — (SER) switch, press to send ID on power line network.
- Wink Function — LED flashes “Ion” to indicate wink function. Press program switch (PGM) to disable wink function.

Equipment Setup Procedure (Non-ERC)

1. Ensure that all valve nozzles are attached to the valves.
2. Observe pressure of CO_2 high pressure tank of 500 psi (34 bar) or more, or bulk CO_2 tank of 150 psi or more. Primary regulator set at 90 psi (6 bar) and the secondary regulator set at 35 psi (2.4 bar).
3. Observe the control panel to verify that all pressure gauges are set at correct operating pressures.
4. Check the syrup tanks to make sure a sufficient number of tanks are connected in series to satisfy business volume.
5. Clean syrup inlet and outlet quick disconnects at the same time tanks are replaced. Rinse disconnects in clean potable water.

Start-up (Non-ERC)

1. Fill the refrigeration unit water bath tank with water to within 1/2" (1.27 cm) of the top of the overflow tube.
2. Open the manual water shut-off valve to the water cooled condenser (if applicable).
3. Turn ON the rocker switch labeled “Refrigeration” to begin building an ice bank.
4. Turn ON the rocker switch labeled “Agitator”.

NOTE: On TS units 3 & 4 are combined into 1 switch.

5. Ice will begin to form on the evaporator coils in approximately 2 hours.
6. The refrigeration unit will build an ice bank in approximately 4 to 6 hours.
7. If optional CO_2/Water Control Panel has been installed on the refrigeration unit, refer to the installation instructions for operation and testing the circuits for leaks.
8. The carbonation circuits “A” and “B,” as well as the syrup circuits must be checked for leaks and possible cross circuits before turning ON the water supply to carbonator pumps.
9. Turn on main water supply. Set incoming regulator to 55 psi on the CO_2 panel; 25 psi for the Model 11M root beer system’s internal regulator (must be lower than CO_2 supply pressure). Once water is supplied to the unit, air needs to be purged from the carbonator tank. Do so by lifting press relief valve tab until water comes out of relief valve.
10. Turn on main CO_2 supply. Set regulator initially to 90 – 100 psi. For the Model 11 Root Beer system, set regulator initially to 26 psi; it can be raised incrementally to 30 psi if there is excessive foaming.
11. Set bag-in-box syrup tank push pressure CO_2 regulator to 65 – 70 psi. For the Model 11 Root Beer system, set push pressure CO_2 regulator to 35 – 40 psi.

PLACING THE CARBONATION SYSTEM IN OPERATION

1. Open the CO_2 gas supply valve at CO_2 tanks or bulk tank. Adjust the CO_2 pressure to 90 psi (6.2 bar).
2. Open relief valve on top of the carbonator tank for 4 seconds to bleed off air in tank.
3. Turn ON the water supply to unit.
4. Turn ON the switch labeled “Carbonator Pump”. Allow carbonator to run and cycle OFF.
5. Activate all valves until a smooth, continuous flow of carbonated water and non-carbonated water appear at the valves.
6. Turn ON switch labeled “Circulator”.
7. Allow at least 1 hour before proceeding to calibration instructions. You may complete the sanitizing instructions during this period.

Sequence of Operation (Non-ERC)

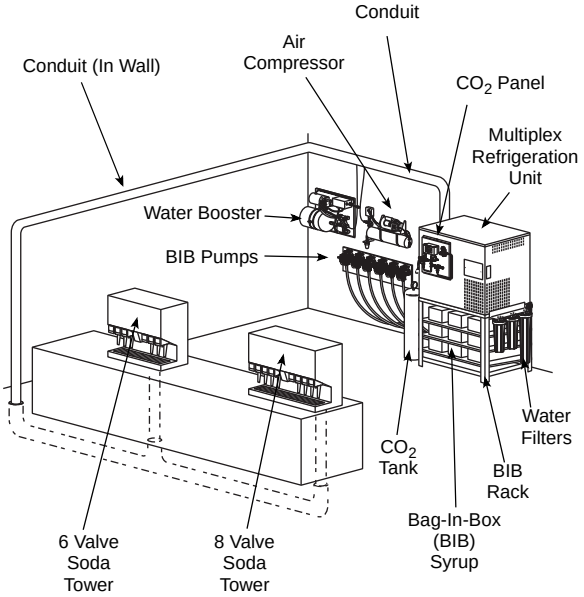
PRE-MIX REFRIGERATION UNIT

Ice Bank Is Required

1. Check water bath for full ice bank.
2. The stabilized water bath operating temperature must be maintained at 33°F (0.6°C) to 35°F (1.7°C).

The following is a sequence of operations for the Multiplex Pre-mix Beverage equipment.

1. Once a drink is dispensed, the following will occur:
   A. For a Syrup Tank System, the Pre-mix syrup is manually mixed at the store. Pre-mix beverage is then transferred to a holding tank for supply to the Multiplex system.
   B. For a Bag-In-Box System, pre-mix syrup is drawn from a Bag-In-Box by means of a gas driven syrup pump.
2. The carbonator pump (stainless) pulls the 5:1 pre-mix out of the 3 gallon holding tank and injects it into the pre-mix carbonator tank where the CO_2 pressure is 35 psi (2.4 bar) on the tank.
3. The circulator pump runs continuously and circulates water bath water through the conduit to provide cooling for all drinks.



Multiplex Pre-mix Beverage System Operation and Layout

Start-up (with ERC)

PLACING EQUIPMENT IN OPERATION

Before placing equipment in operation, verify that all requirements for roof mounted Remote Condenser Units (if applicable) have been satisfied. Refer to the instructions on installing the Remote Condenser. Verify proper supply power to unit.

1. Fill the refrigeration unit water bath tank with water to within 1/2" (1.27 cm) of the top of the overflow tube.
2. Open the manual water shut-off valve to the water cooled condenser (if applicable). Refer to “Electronic Control” for control programming sequence.
3. Press “Comp/Agit” to begin building an ice bank.
4. Ice will begin to form on the evaporator coils in approximately 2 hours.
5. The refrigeration unit will build an ice bank in approximately 4 to 6 hours.
6. If optional CO_2/Water Control Panel has been installed on the refrigeration unit, refer to the installation instructions for operation and testing the circuits for leaks.
7. The carbonation circuits “A” and “B,” as well as the syrup circuits must be checked for leaks and possible cross circuits before turning ON the water supply to carbonator pumps.
8. Turn on main water supply. Set incoming regulator to 55 psi on the CO_2/Water control panel. Once water is supplied to the unit, air needs to be purged from the carbonator tank. Do so by lifting press relief valve tab until water comes out of relief valve.
9. Set bag-in-box syrup tank push pressure CO_2 regulator to 60 psi.

PLACING THE SYRUP SYSTEM IN OPERATION

1. Open the CO_2 gas supply valve at CO_2 tanks or bulk tank. Adjust the CO_2 pressure to 90 psi (6.2 bar).
2. Open relief valve on top of the carbonator tank for 4 seconds to bleed off air in tank.
3. Verify the water supply to unit is on.
4. Press the switch labeled “Carb A” (and B if applicable). Allow carbonator to run and cycle OFF.
5. Press the switch labeled “CIRC A” (and “CIRC B” if applicable).
6. Activate all vales until a smooth, continuous flow or carbonated water and non-carbonated water appear at the valves.
7. Allow at least 1 hour before proceeding to calibration instructions. You may complete the sanitizing instructions during this period.

Sequence of Operation (with ERC)

ELECTRONIC CONTROL

Prerequisites

- Potable water must be connected to the carbonator pump circuit.
- The ice bank water bath water must cover the evaporator. The compressor will not start unless the ice bank control probes are immersed in water.
- CO_2 must be supplied.

Initial Power-up

The control has a 30-second delay when power is connected, or disconnected and reconnected. The display will show Pd30 - power delay and 30 seconds left in the countdown cycle.

Normal Two Circuit Operation

Pressing the COMP/AGIT button will start the water bath agitator immediately and initiate the 180 second compressor delay. The display will show Cd99 (compressor delay & 99 seconds) and will start to count down from 99 seconds after the first 81 seconds have elapsed. After 180 seconds the compressor and condenser fan motor energize and the COMP/AGIT LED flashes. Pressing the CARB A and CARB B buttons will power the carbonator tank liquid level control. The corresponding LED flashes to indicate the pump is running. Pressing the CIRC A & CIRC B buttons will immediately energize the circulating pumps and energize the LED constantly. The display will show the circulating temperature and show the A circuit. When two circuits are used the readout will alternate between A and B circuits every 5 seconds.

The compressor and condenser fan will continue to run until ice contacts the ice bank control probe closest to the evaporator. When ice contacts the probe, the COMP/AGIT LED lights constantly and the compressor and condenser fan motor de-energize.

As the ice bank melts, the ice bank control probe will lose contact with the ice; the LED will flash and the compressor and condenser fan motor will restart. This cycle will repeat as required depending on load.

Power Interruption

During a power interruption the control will resume from the point of interruption when power is reapplied and the time delay expires. Any switches/components that were energized when power was interrupted will be energized when power is reapplied.

Error Codes

E1 = Low Water Supply Pressure

E2 = Low CO_2 Pressure

E3 = Low Water Level - Water Bath

E4 = High Water Bath Temperature

E5 = High Water Supply Pressure

E6 = High Refrigeration Temperature

E7 = High Ice Bank Size (Probe Sensor 2)

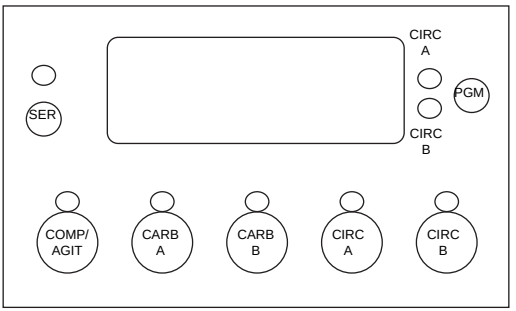
E8 = Long Carb A Run Time

E9 = Long Carb B Run Time

NOTE: Shorted Transducer = "----"

Open Transducer = "===="

Error codes will display until corrected.



Control Programming

SER Switch

- For when optional LON communication network is connected.

PGM Switch

- Used to enter and exit programming modes.
- Press **PGM** Switch **F000** will display
  - Press and hold Carb A switch — Display will indicate **Water Bath Temperature**
  - Press and hold Circ A switch — Display will indicate **Discharge Temperature**
  - Press and hold Circ B switch — Display will indicate **Suction Temperature**
- Press **PGM** Switch **P000** will display
  - Press and hold Carb A switch — Display will indicate **Water Pressure**
  - Press and hold Carb B switch — Display will indicate **CO2 Pressure**

Press and hold PGM switch for 3 seconds to save settings and exit program mode.

Program Mode 1

To enter, press and hold switch for 3 seconds.

- **0001** will display indicating Mode 1
- Wait 3 seconds — **C000** will display
- Press and hold Carb A switch — Display will indicate one of the following:
  - **CA00** — Low and High Probes are open (carbonator motor is energized)
  - **CA11** — Low and High Probes are closed (carbonator motor is de-energized)
  - **CA01** — Low Probe closed (Motor will still be on)

- Press and hold Carb B switch — Display will indicate one of the following:
  - **Cb00** — Low and High Probes are open (carbonator motor is energized)
  - **Cb11** — Low and High Probes are closed (carbonator motor is de-energized)
  - **Cb01** — Low Probe closed (Motor will still be on)
- Press and hold COMP/AGIT switch — Display will indicate one of the following:
  - **CL 0** — Water level low
  - **CL 1** — Water level OK

Program Mode *2*

Add circulation pumps C & D.

- Press PGM button for 3 seconds — Display shows **0001**.
- Press PGM button — Display shows **0002** program mode 2.
- Wait 3 seconds — Display shows **-002** = Factory default setting.
  - Pressing CIRC A button energizes/de-energizes pump A
  - Pressing CIRC B button energizes/de-energizes pump B
- Program CIRC C — Press CARB A button – Display shows **-102** = Carb A button energizes/de-energizes pump C
- Program CIRC D — Press CARB B button - Display shows **-012** = Carb B button energizes/de-energizes pump D

Press and hold PGM switch for 3 seconds to save settings and exit program mode.

Program Mode 4

Temporarily cancel display of error codes. Cancelling the error codes allows circulating glycol temperatures to be displayed until the error can be corrected.

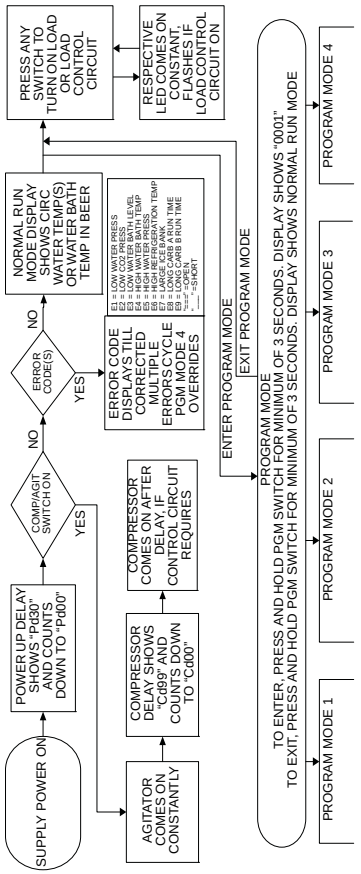
- Press PGM button for 3 seconds — Display shows **0001**.
- Press PGM button three times — Display shows **0004** program mode 4.
- Wait 3 seconds — Display shows **-004** = All error codes will be displayed during run mode.
- Press COMP/AGIT button once — Display shows **---4** = error codes will not be displayed during run mode.

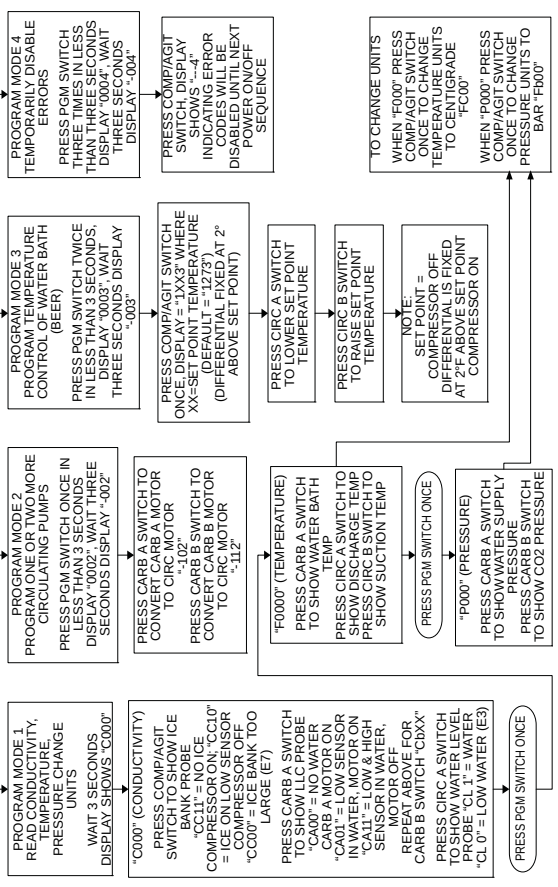
NOTE: Disconnecting and reconnecting main power will reset the control board to the factory setting **-004** = Error codes will be displayed in the run mode.

Equipment Setup Procedure (with ERC)

1. Ensure that all valve nozzles are attached to the valves.
2. Observe pressure of CO_2 high pressure tank of 500 psi (34 bar) or more, or bulk CO_2 tank of 150 psi or more. Primary regulator set at 90 psi (6 bar) and the secondary regulator set at 35 psi (2.4 bar).
3. Observe the control panel to verify that all pressure gauges are set at correct operating pressures.
4. Check the syrup tanks or BIB to make sure a sufficient number of tanks are connected in series to satisfy business volume.
5. Clean syrup inlet and outlet quick disconnects at the same time tanks are replaced. Rinse disconnects in clean potable water.

Multiplex Electronic Refrigeration Control (ERC) Programming

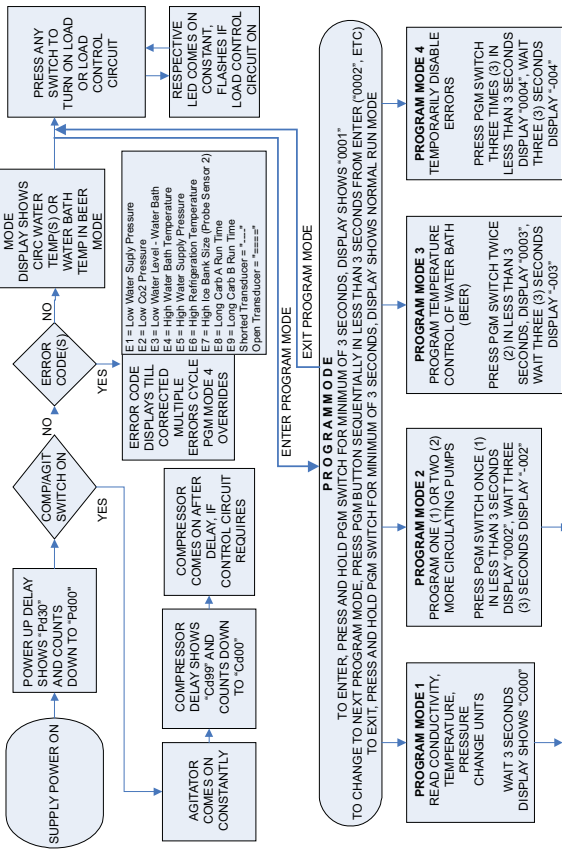




Equipment Close Procedure — All Units

1. Clean the underside of the dispensing tower around the nozzle area with a clean damp towel.
2. Pour at least 60 oz (1.8 liters) of warm water down the drain openings.

MULTIPLEX ELECTRONIC REFRIGERATION CONTROL (ERC) PROGRAMMING



"C000"(CONDUCTIVITY)

PRESS COMP/AGIT SWITCH TO SHOW ICE BANK PROBE
"CC11" = NO ICE COMPRESSOR ON
"CC10"= ICE ON LOW SENSOR COMPRESSOR OFF
"CC00" = ICE BANK TOO LARGE (E7)

PRESS CARB A SWITCH TO SHOW LLC PROBE
"CA00" = NO WATER CARB A MOTOR ON
"CA01"= LOW SENSOR IN WATER, MOTOR ON
"CA11" = LOW & HIGH SENSOR IN WATER, MOTOR OFF
REPEAT ABOVE FOR CARB B SWITCH "CbXX"

PRESS CARB B SWITCH TO CONVERT CARB B MOTOR TO CIRC MOTOR
"-112"

"F000" (TEMPERATURE)
PRESS CARB A SWITCH TO SHOW WATER BATH TEMP

PRESS CIRC A SWITCH TO SHOW LIQUID LINE TEMP
PRESS CIRC B SWITCH TO SHOW SUCTION TEMP

PRESS PGM SWITCH ONCE (1)

"P000" (PRESSURE)

PRESS CARB A SWITCH TO SHOW WATER SUPPLY PRESSURE
PRESS CARB B SWITCH TO SHOW CO2 PRESSURE

PRESS COMP/AGIT SWITCH ONCE, DISPLAY ="1XX3" WHERE XX= SET POINT TEMPERATURE (DEFAULT = "1273") (DIFFERENTIAL FIXED AT 2° ABOVE SET POINT)

PRESS CIRC A SWITCH TO LOWER SET POINT TEMPERATURE

PRESS CIRC B SWITCH TO RAISE SET POINT TEMPERATURE

NOTE:
SET POINT = COMPRESSOR OFF
DIFFERENTIAL IS FIXED AT 2°F ABOVE SET POINT COMPRESSOR ON

PRESS COMP/AGIT SWITCH, DISPLAY SHOWS "---4" INDICATING ERROR CODES WILL BE DISABLED UNTIL NEXT POWER OFF/ON SEQUENCE

TO CHANGE UNITS

WHEN "F000" PRESS COMP/AGIT SWITCH ONCE (1) TO CHANGE TEMPERATURE UNITS TO CENTIGRADE
"FC00"

WHEN "P000" PRESS COMP/AGIT SWITCH ONCE (1) TO CHANGE PRESSURE UNITS TO BAR
"Fb00"

Electronic Refrigeration Control (ERC) Model Error Codes

- Error codes will interrupt the temperature display and stay active until the error is corrected.
- If multiple errors are present, the errors will rotate and display every 5 seconds.
- Resetting errors — After correcting the problem, the respective switch for the error must be cycled OFF and then ON to reset.
- Disconnecting and reconnecting power will erase all errors.

Error Code	Error	Cause
E1	Low Water Supply Pressure	Lower than 5 psi for 5 Seconds
E2	Low CO_2 Pressure	Lower than 10 psi for 5 Seconds
E3	Low Water Level – Water Bath	Must Cover Top of Evaporator
E4	High Water Bath Temperature	Water Bath Temperature Greater Than 45°F
E5	High Water Supply Pressure	Water Pressure Greater than 75 psi
E6	High Refrigeration Temperature	Discharge Line Temperature Greater than 190°F
E7	High Ice Bank Size	Ice Contacting Center Ice Bank Probe
E8	Long Carb A Run Time	Energized for 7 Continuous Minutes
E9	Long Carb B Run Time	Energized for 7 Continuous Minutes

Checklist

If a problem arises during operation of your post mix soda refrigeration unit, follow the checklist below. Routine adjustments and maintenance procedures are not covered by the warranty.

⚠ Warning

Only trained and certified electrical and plumbing technicians must service this unit. All wiring and plumbing must conform to national and local codes.

Problem	Possible Cause	To Correct
Water only dispensing: No pressure	Regulator(s) out of adjustment	Check/adjust regulator(s).
	Out of CO_2	Install fresh tank.
	Defective regulator(s)	Check/repair/replace regulator(s).
	CO_2 line pinched, kinked, or obstructed	Check/repair/replace CO_2 line.
Syrup and CO_2 only dispensing: Carbonator	No power	Check power supply. Plug in carbonator or reset breaker.
	Water supply	Make sure water is turned ON.
		Replace water filter.
		Check/clean/replace pump strainer.
		Check/clean/repair water check valve.
		Check for frozen water line. Internal Carbonator unit only.
	Defective carbonator	Check/repair/replace carbonator pump, motor, electrode or liquid level control.
Syrup and plain water only dispensing: No pressure	Out of CO_2	Install fresh tank.
	HP regulator out of adjustment	Adjust HP regulator to the proper setting.
	Defective HP regulator	Check/repair/replace HP regulator.
	CO_2 line pinched, kinked, or obstructed	Check/repair/replace CO_2 line.
One valve will not dispense anything: Is there power to the valve?	Broken wire or loose connection	Replace/repair wire or connector.
	Bad microswitch	Replace microswitch.

Problem	Possible Cause	To Correct
Beverage dispensed is too sweet: Is the ratio (brix) of the drink correct?	Flow control out of adjustment	Adjust the flow control.
	Insufficient soda flow due to low carbonator pressure	Adjust CO_2 pressure or change the tank.
	Low CO_2 pressure due to leaks	Repair CO_2 leaks.
	Obstruction in the water or soda line	Clean out the lines.
Beverage is not sweet enough: Is the ratio (brix) of the drink correct?	Flow control out of adjustment	Adjust the flow control.
	Soda flow too high	Reset CO_2 pressure or replace regulator if necessary.
	Obstruction in syrup line	Clean out the syrup line.
Drinks are foaming: Are system pressures correct?	Over carbonation	Check CO_2 supply. Reset pressure or replace regulator is necessary.
	Dirty lines/valves	Clean/sanitize entire system.

X - Specific problem listed in section
R - Problem refer to from section with "X"

CO_2 Gas System

On units not equipped with Air Pump, check all **Probable Causes** listed below.

Qualifier	Probable Cause	Corrective Action
Loss of CO_2		
If leak occurs while Change-over valve is positioned on Air, follow the "Probable Causes" (for units equipped with Air Pump).	CO_2 Tank leaking.	Use a soap solution around CO_2 Tank valve Stem to locate leaks. If leaks are present, bubbles will appear. If valve Stem leaks at Tank, replace CO_2 Tank.
	CO_2 Washer damaged or missing.	Use a soap solution around Primary Regulator Coupling Nut and CO_2 Tank Stem. If bubbles appear, remove Regulator and replace CO_2 Washer found inside Nut. Secure Regulator to Tank and check for leaks.
	Primary Regulator Diaphragm leaking.	Use a soap solution around Primary Regulator Adjustment Screw in Bonnet. If bubbles appear, diaphragm is leading. Replace Primary Regulator.
	Ruptured Line Assembly or leaks at connections.	Use a soap solution around all connections. If bubbles appear, tighten loose connections carefully.
	A to B Change-over Valve leaking.	Use a soap solution around A and B CO_2 Tank Change-over Valve, tighten if bubbles appear at Connections to stop leaks.
	CO_2 Low Pressure Switch leaking.	Use a soap solution around Low Pressure CO_2 Switch. If bubbles appear at pipe, tighten Connection. If bubbles appear at Terminal end of Switch - replace Switch.
	CO_2 Check valve leaking.	Use a soap solution around Check valve. If bubbles appear, tighten Connection to stop leaks.
	Back Flow Preventer stuck open.	Use a soap solution around Back Flow Preventer. Tighten if bubbles appear at connection. If bubbles appear at Vent Hole on underside of Back Flow Preventer, clean out or replace Back Flow Preventer valve and corresponding Water Check valve.
	Carbonator Tank Relief valve leaking.	Use a soap solution around Relief valve. If bubbles appear, replace Relief valve.
If leak occurs only while Change-over valve is positioned on CO_2, refer to Troubleshooting "Syrup System".	Gas leak at the syrup system.	Refer to Troubleshooting "Syrup System" under **No syrup or insufficient syrup in finished drink**.

Qualifier	Probable Cause	Corrective Action
Flat drinks (lack of carbonation in carbonated water)		
Primary Regulator (less than 500 psi [34.5 bar]).	CO_2 Supply exhausted (CO_2 Tank is functionally empty if pressure reads less than 500 psi [34.5 bar]).	Verify CO_2 Tank pressure is a minimum of 500 psi (34.5 bar) on the Primary Pressure Regulator Gauge marked 0-2000 psi. Replace tank if necessary.
	Primary Regulator out of adjustment or inoperative.	Verify CO_2 Primary Regulators are set at 90 psi (6.3 kg/cm^2). Adjust if necessary. If Regulator will not stay in adjustment, replace Regulator.
CO_2 Supply adequate (greater than 500 psi [34.5 bar]).	A and B CO_2 Tank Change-over Valve incorrectly positioned.	If A and B CO_2 Tank Change-over Valve is positioned on an empty Tank or halfway between A and B operating positions, CO_2 is not supplied to Carbonators. Ensure valve handler is in the “operating” position.
	Malfunction of the Refrigeration System.	Refer to Troubleshooting “Refrigeration System” under **Warm drinks**.
	Water Filter restricted.	Refer to Troubleshooting “Water Filter System” under **Peculiar taste**.
	Malfunction of the Carbonated Water System.	Refer to Troubleshooting “Carbonated Water System” under **Flat drinks**.
Excessive carbonation (foaming).	Primary Regulators set too high.	Verify CO_2 Primary Regulators are set at 90 psi (6.3 kg/cm^2). Adjust if necessary. If Regulator will not stay in adjustment, replace regulator. Replace.
Low Pressure CO_2 Warning light or buzzer does not come **ON**.	Warning lamp or buzzer burned out. Transformer inoperative.	When CO_2 Tank is empty and CO_2 warning lamp(s) or buzzer fail, verify voltage across Transformer. If no voltage, replace Transformer.
	Pressure Switch defective.	If CO_2 Warning lamps or buzzer and transformer are operative. Pressure Switch is defective and must be replaced.

Qualifier	Probable Cause	Corrective Action
Flat drinks (lack of carbonation in carbonated water) (continued)		
Low Pressure CO_2 Warning light or buzzer does not go **OFF**.	Leaks on system.	If leaks exist on CO_2 System, not enough pressure is maintained to allow Pressure Switch to cut OFF CO_2 Warning light or buzzer. Use a soap solution to located possible leaks. Tighten connections carefully.
	Primary Regulator out of adjustment.	Check CO_2 supply. The Primary Regulators must be set at 90 psi (6.3 kg/cm^2). Adjust if necessary. If regulator will not stay in adjustment, replace regulator.
	Pressure Switch inoperative.	Carefully disconnect one wire from the CO_2 Pressure Switch, if CO_2 Warning Lamps go out, the CO_2 Pressure Switch is defective and should be replaced. Carefully disconnect one wire from the CO_2 Pressure Switch, if CO_2 Warning Lamps go out, the CO_2 Pressure Switch is defective and should be replaced.
Water found in CO_2 Regulator and lines.	CO_2 Check Valve defective.	Turn CO_2 **OFF** at CO_2 Tank valve. Remove top Cover from Remote Refrigeration Unit. Locate CO_2 Check valve on top of Carbonator Tank. Remove CO_2 line on Inlet side of Check Valve. If CO_2 is present, escaping from Carbonator Tank, clean out or replace Check valve.

Carbonated Water System

Qualifier	Probable Cause	Corrective Action
Flat drinks		
Malfunctioning of Refrigeration System.	Beverages at dispensing tower are above 40°F (5°C).	Refer to Troubleshooting "Refrigeration System" under **Warm drinks**.
Malfunctioning of Circulating System.		Refer to Troubleshooting "Circulating System" under **Warm drinks**.
Beverages at dispensing tower are below 40°F (5°C).	CO_2 supply exhausted.	Verify CO_2 Tank pressure is a minimum of 500 psi (35 kg/cm^2) on Primary Pressure Regulator Gauge marked 0-2000 psi. Switch to full tank if necessary.
		Ensure CO_2 Shut-off Valves to Carbonators are both in the **ON** position. Refer to Troubleshooting "CO_2 Gas System" under **Flat drinks**.
	Primary CO_2 Regulator out of adjustment or inoperative.	Verify CO_2 Primary Regulators are set at 90 psi (6.3 kg/cm^2). Adjust if necessary if Regulator will not stay in adjustment replace Regulator.
	Water Regulator incorrectly adjusted or inoperative.	Verify Filtered Water Pressure Gauge registers 55 psi (3.9 kg/cm^2), if higher than 55 psi, flooding of Carbonator will occur. To adjust, loosen Locknut, turn Adjustment Screw clockwise to increase, counterclockwise to decrease. If regulator will not respond to adjustments, replace regulator.
	Improper water treatment.	Verify By-pass handle is in the "filter operating" position. Ensure Filter Cartridge is still effective, if necessary replace Cartridge. Refer to Troubleshooting "Water Filter System"
	Carbonator Pump worn (Brass pump).	Dispense Carbonated Water while listening for carbonator pump and motor to cycle **ON** at Refrigeration Unit. Pumps should operated between 6 to 12 seconds before cycling **OFF**. If operating time exceeds 30 seconds carbonator pump is worn, replace Pump.
	Pressure Relief Valve is leaking.	Remove top cover from Remote Refrigeration Unit. Dispense Carbonated Water until carbonator Pumps and Motor cycle **ON**. Observe Pressure Relief Valves on carbonator Tank. If water is observed escaping from either, replace leaking Relief valve. ***Note:*** *Do not confuse the Water Bath Make-up valve for the carbonator Tank Relief valves.*

Qualifier	Probable Cause	Corrective Action
Beverages at Dispensing Tower are below 40°F (5°C). (continued)	Back Flow Preventer.	Remove top cover from Remote Refrigeration Unit. Use a soap solution around Back Flow Preventer. If bubbles appear at Vent Hole or underside of Back Flow Preventer, clean or replace Back Flow Preventer and corresponding Water Check valve carbonator Tank.
	Double Check valve (water) stuck open.	With top cover from Remote Refrigeration Unit removed and carbonator Pump Switch and Water turned **OFF**, loosen water supply line at inlet side of Double Check valve Assembly. If CO_2 gas escapes from Check valve, it must be cleaned or replaced.

Qualifier	Probable Cause	Corrective Action
No carbonated water at any of the dispensing valves		
No CO_2 gas or water present at dispensing valves.	Malfunction of Refrigeration System.	Refer to Troubleshooting "Refrigeration System" under **No carbonated water at any of the dispensing valves (freeze up)**.
	Malfunction of Circulating System.	Refer to Troubleshooting "Circulating System" under **No carbonated water at any of the dispensing valves**.
CO_2 gas is present at dispensing valves but no water.	No power to carbonator.	Verify toggle switch for Carbonator is in the **ON** position and Main Power Supply is **ON**.
	Water supply restricted to carbonator pump.	Verify water to unit by observing Filtered Water Pressure Gauge. It should register 55 psi (3.9 kg/cm^2). To adjust, loosen Locknut, turn Adjustment Screw clockwise to increase, counterclockwise to decrease. If regulator will not respond to adjustments, replace regulator. Examine Water Shut-off Valve(s) to Carbonator and ensure they are in the **ON** position.
	Water Filter restricted.	Place Filter By-pass Valve into the Filter By-pass position. Replace Cartridge Filter. Reposition valve handle to "operating" position.
	Water Inlet strainer clogged.	Remove Filter Screen from Inlet Strainer in carbonator Pump (Brass), flush with water to clean and reassemble.
	Liquid Level Control defective.	Push Toggle Switch for carbonator and circulator to the **OFF** position. Shut **OFF** Main Power Supply unit. Remove electrical Access Panel from unit. Locate liquid level control. Using a pair of insulated needle nose pliers, carefully remove the **white** wire from the terminal marked "H" and the **black** wire from the terminal marked "L" on the Liquid Level Control Board. Position safely to side. Turn **ON** Main Power Supply. Push carbonator Switch to the **ON** position. If carbonator pump and motor do not cycle **ON** immediately, that Liquid Level Control is defective. Replace.
	Electrode Assembly defective.	If Liquid Level Control is operating, test the Electrode Assembly, refer to Probable Cause "Liquid Level Control Defective". Verify wire leads are dry and that they are not touching. If not, replace Electrode.

Qualifier	Probable Cause	Corrective Action
No carbonated water at any of the dispensing valves (continued)		
CO_2 gas is present at Dispensing Valves but no water. (continued)	Carbonator Pump worn (Brass pump).	Dispense Carbonated Water while listening for carbonator pump and motor to cycle **ON** at Refrigeration Unit. Pumps should operate between 6 to 12 seconds before cycling **OFF**. If operating time exceeds 30 seconds, carbonator Pumps is worn, replace Pump.
	Motor defective.	If Motor will not operate, verify voltage across Motor Terminals with voltmeter. If voltage reads 110 to 120 VAC, the Motor or Pump is defective. Loosen the Coupling Clamp with a flat-blade screwdriver and disengage Pump from Motor. If Motor still will not operate with Pump disengaged, Motor is defective. Replace.
	Carbonator Pump frozen.	Loosen the Coupling Clamp with a flat-blade screwdriver and disengage Pump from Motor. By hand, turn the Coupling Key in back of Pump. If pump shaft will not spin freely, Pump is defective and must be replaced.

Qualifier	Probable Cause	Corrective Action
Carbonator pump and motor will not cycle OFF (possibly noisy pump)		
Little or no carbonated water at dispensing valve.	Primary CO_2 Regulator adjusted at extremely high pressure.	Verify CO_2 Primary Regulators are set at 90 psi (6.3 kg/cm^2). Adjust if necessary. If regulator will not star in adjustment, replace regulator.
	Water supply to Carbonator Pump shut-off or restricted.	Verify water to unit by observing Filtered Water Pressure Gauge. It should register 55 psi (3.9 kg/cm^2). Examine Water Shut-off Valves to carbonator and ensure they are in the ON position. Examine Pump Strainer for restriction. Clean if necessary.
	Water Filter restricted.	Place Filter By-pass valve into the “Filter By-pass” position. If carbonator pump and motor immediately cycle **OFF**, Filter Cartridge is restricted. Replace Cartridge.
	Back Flow Preventer or Double Check Valve.	Examine Filter Water Pressure Gauge. If it registers 90 psi (6.3 kg/cm^2) CO_2 gas is passing from the carbonator tank and through the Back Flow Preventer or Double Check Valve, preventing water from entering pump. Clean or replace Back Flow Preventer/Double Check Valve.
	Carbonator Pump worn.	Remove top cover from Remote Refrigeration Unit. Locate Toggle Relief Valve on Carbonator Tank and lift lever to allow CO_2 gas to escape from Tank for 30 seconds. If during this time Carbonator Pump cycles **OFF**, pump is worn and should be replaced.
	Coupling Key defective.	Loosen the Coupling Clamp with a flat-blade screwdriver and disengage Pump from Motor. Examine Coupling Key in Pump. If defective, replace.

Qualifier	Probable Cause	Corrective Action
Carbonator pump and motor will not cycle OFF (possibly noisy pump) (continued)		
Carbonated water at dispensing valve.	Liquid Level Control defective.	Shut **OFF** main power supply to unit and push Toggle Switch for Carbonator and Circulator to the **OFF** position. Remove Electrical Access Panel from Refrigeration Unit and locate Liquid Level Control. Strip a 1-1/2" (3.8 cm) piece of solid strand wire of insulation to use as a jumper. Turn main power supply unit **ON** to unit. With a pair of insulated pliers, jump across Terminals marked "G, H and L" on Liquid Level Control. Simultaneously, while pushing corresponding Toggle Switch to "carbonator" to the **ON** position. If carbonator pump and motor continue to operate after Liquid Level Control Jumper Wire is in place, Liquid Level Control is defective, replace.
	Electrode defective.	Examine wire leads to ensure no breaks in connections. Remove and clean Electrode with find sand paper and reinstall. ***Note:*** *Reversing Electrode Wire Leads on either electrode or Liquid Level Control will cause erratic operation of carbonator Motor. Refer to Wiring Diagram.*
Peculiar taste in carbonated water only.	Water filter contaminated.	Refer to Troubleshooting "Water Filter System" under **Peculiar taste**.
	Back Flow Preventer Valve leaking or Double Check Valve leaking.	Push Toggle Switch for carbonator to the **OFF** position. Turn Water Shut-off Valve to carbonator to the **OFF** position. Remove tope cover from Remote Refrigeration Unit. Carefully disconnect water line on the outlet side of the carbonator pump. If water or CO_2 is observed continually escaping from line, Back Flow Preventer/Double Check Valve is leaking. Disassemble, clean, and replace if necessary. ***Caution:*** *Carbonated water must never be allowed to flow through materials other than plastic or stainless steel. (Copper, zinc or galvanized material is non-acceptable.)*
	Carbonated water flowing through materials other than plastic or stainless.	Trace carbonated water flow through system. Ensure no foreign materials are present. Replace non-acceptable material if found.

Qualifier	Probable Cause	Corrective Action
Carbonator pump and motor will not cycle OFF (possibly noisy pump) (continued)		
Carbon particles in furnished drink.	Malfunction of Water Filter.	Refer to Troubleshooting "Water Filter System" under **Carbon particles in finished drinks**.
	Defective Carbonator Pump.	Remove top cover from Refrigeration Unit. Loosen Coupling Clamp with a flat-blade screwdriver and disengage pump from motor. Turn the Coupling Key by hand, in back of pump. If pump shaft does not turn freely and/or Carbon is found in pump, carbon veins are defective. Replace pump.
Carbonator Motor cycles **ON** and **OFF** in short cycles.	Defective Circulating Pump.	Refer to Troubleshooting "Circulating System" under **Carbon particles in finished drinks**.
	Electrode Assembly incorrectly wired or defective.	Examine wiring diagram found on Refrigeration Unit. Verify Electrode wiring leads are on proper terminals of both Electrode and Liquid Level Control. If problem still occurs, replace electrode.

Circulating System

Qualifier	Probable Cause	Corrective Action
Warm drinks		
Drinks warm throughout the day, warm all the time.	Malfunction of Refrigeration System.	Refer to Troubleshooting "Refrigeration System" under **Warm drinks (carbonated water temperature over 40°F [5°C])**.
Drinks warm during periods of low demand, much colder during periods of high demand.	No power to Circulating Motor.	Verify Switch to Circulating Motor is in the **ON** position and Main Power Supply is **ON**.
Carbon Particles in finished drink.	Motor defective.	Using a flat-blade screwdriver, loosen the Coupling Clamp and disengage Pump from Motor. If Motor will not operate, verify voltage across Motor Terminal with voltmeter. If voltage reads from 110 to 120 VAC, the Motor is defective and should be replaced.
	Circulating Pump defective (stainless steel).	Dispense approximately 1 gallon of carbonated water at dispensing valves. If temperature of carbonated water drops, Circulating pump is not operating. Examine Coupling Key found between Pump and Motor Shaft. If coupling key is defective, replace. If key is operational, Circulating pump is defective, replace.
No CO_2 gas or water present at dispensing valve.	Malfunction of Water Filter.	Refer to Troubleshooting "Water Filter System" under **Carbon particles in finished drinks**.
	Malfunction of Carbonated Water System.	Refer to Troubleshooting "Carbonated Water System" under **Carbon particles in finished drinks**.
	Circulating Pump defective (Stainless Steel).	Remove top cover from Refrigeration Unit. Loosen Coupling Clamp with a flat-blade screwdriver and disengage Pump from Motor. Turn Pump shaft with screwdriver. If Pump does not turn freely and/or carbon is found in Pump, carbon veins in pump are defective. Replace Circulating Pump.
CO_2 gas is present at dispensing valves but no carbonated water.	Malfunction of Refrigeration System.	Refer to Troubleshooting "Refrigeration System" under **No carbonated water at dispensing valve (freeze up)**.
	Particles obstructing flow through Circulating Circuit (In-line Strainer).	Remove top cover from Remote Refrigeration. Push toggle switch to carbonator and circulator to the **OFF** position. Lift lever on Toggle Relief valve at top of carbonator Tank until pressure is completely released. Remove In-line Strainer Screen. Flush with clean water and reassemble.
	Malfunction of Carbonating System.	If CO_2 gas is present at the Dispensing Valves and there is no water, the problem is in the Carbonated Water System. Refer to Troubleshooting "Carbonated Water System".

Compressed Air System

Until repairs can be made on Compressed Air System, place Air/CO_2 Change-over Valve in the CO_2 Operating position.

Qualifier	Probable Cause	Corrective Action
No syrup		
Air Compressor will not cycle **ON** and Air Pressure Gauge registers 0 psi.	No power to Air Compressor.	Verify Toggle Switch to Air Compressor is in the **ON** position and main power supply is **ON**.
	Pressure Switch defective.	Remove Pressure Switch Cover and use a voltmeter across Switch to determine whether “open” or “closed”. If in “open” position, replace switch.
	Motor defective.	Verify voltage across Motor with a voltmeter, if Motor/Pump assembly will not operate, it is defective and should be replaced.
	Pump frozen.	Same as above for Motor defective.
Air Compressor cycles **ON** and **OFF** and Air Pressure Gauge readings range between 70 psi (4.9 kg/cm^2) to 90 psi (6.3 kg/cm^2).	Air/CO_2 Change-over Valve placed in incorrect position.	Place Air/CO_2 Change-over Valve to the Air or CO_2 “operating” position. ***Note:*** *If lever is positioned between Air and CO_2 the gas supply is shut* ***OFF*** *to syrup system.*
	Malfunction of Syrup System.	Refer to Troubleshooting “Syrup System”, under **No syrup**.
	Malfunction of Refrigeration System.	Refer to Troubleshooting “Refrigeration System”, under **No carbonated water at dispensing valves (freeze up)**.

Qualifier	Probable Cause	Corrective Action
No syrup (continued)		
Air Compressor operates excessively.	Leak at Shake Machine, Orange Juice Dispenser or other optional equipment.	Turn air supply to Shake Machine to **OFF** position. If Air Compressor cuts out and maintains pressure, leak is at Shake Machine or Orange Juice Dispenser. Refer to manufacturer's manual for Troubleshooting.
	Leak at Compressed Air System.	Use a soap solution around all connections starting from the Air Motor/Pump assembly to the Low and Medium Pressure Syrup Regulators. If bubbles appear, tighten loose connections carefully.
	Automatic Drain or Petcock leaking.	Place drain line for bottom of Automatic Drain or Petcock in cup of water. If air bubbles appear, Automatic Drain or Petcock is leaking. Clean and/or replace as necessary.
	Air leak in syrup system.	Refer to Troubleshooting "Syrup System" under **No syrup, air leak at syrup system**.
	Restricted Germicidal Filter on Air Compressor.	Replace Germicidal Filter. ***Note:*** *This Filter is not designed to be cleaned, but must be replaced when exhausted.*
	Water in Air Accumulator Tank.	Verify Automatic Drain is operating. If inoperative or defective, replace. If unit is not equipped with Automatic Drain use Petcock to remove water from tank.
	Motor/Pump Assembly inoperative.	If Motor/Pump assembly operate without building up to 90 psi (6.3 kg/cm^2) as needed to cycle **OFF**. Pump Assembly is defective and must be replaced.
	Pressure Switch improperly adjusted or defective.	Observe Air Pressure Gauge to ensure proper cycle **ON** at 70 psi (4.9 kg/cm^2) and cycle off at 90 psi (6.3 kg/cm^2) settings. Refer to instructions found under Switch cover for adjusting. If Switch will not respond to adjustment, replace switch.
	Check valve defective.	While Air Compressor is in the **OFF** cycle, use a soap solution around Head Gasket on Motor/Pump Assembly. If bubbles appear, replace Check valve located on the Air Accumulator Tank.
Peculiar taste in finished product.	Contaminated Germicidal Filter on Air Compressor.	Replace Germicidal Filter. ***Note:*** *This filter is not designed to be cleaned, but must be replaced when exhausted.*
	Water in Air Accumulator Tank.	Drain trapped water from tank by removing Drain Line from top of Automatic Drain. Disassemble and clean Automatic Drain. If unit is not equipped with automatic drain, use petcock to remove water from tank.
	Water Filter contaminated.	Refer to Troubleshooting "Water Filter System" under **Peculiar taste**.

Dispensing Valve and Tower

Qualifier	Probable Cause	Corrective Action
All corresponding valves dispensing no syrup.	Malfunction of syrup system.	Refer to Troubleshooting “Syrup System” under **No syrup or insufficient syrup in finished drink**.
No syrup at only one dispensing valve.	Syrup Shut-off Valve closed or partially closed.	Remove top cover from Dispensing valve or Tower. Locate Syrup Shut-off Valve on right hand side of Dispensing valve. Verify shut-off is turned fully open.
	Mounting Block restricted.	Remove Dispensing valve from Mounting Block. Place cup over Syrup outlet on Mounting Block and carefully open Syrup Shut-off Valve. If little or no syrup is present, Mounting Block is restricted. Remove and clean mounting block. Replace if necessary.
No syrup or insufficient syrup in finished drink		
No carbonated water at half or all dispensing valves.	Flow Control our of adjustment or inoperative.	Readjust Flow Control to proper Brix. If no response, clean Syrup Flow Control. Replace if necessary.
	Valve Port restricted.	Clean Syrup valve Port Assembly.
	Seat swollen.	Replace Syrup Seat.
	Solenoid Coil defective.	Replace Syrup Solenoid Coil.
	Malfunction of Carbonated Water System.	Refer to Troubleshooting “Carbonated Water System” under **No carbonated water at any of the dispensing valves**.

Qualifier	Probable Cause	Corrective Action
No carbonated water or insufficient carbonated water in finished drink		
No Carbonated Water only at one dispensing valve.	Carbonated water Shut-off Valve closed or partially closed.	Remove top cover from Dispensing valve or Tower. Locate Carbonated Water Shut-off Valve on left hand side of Dispensing valve. Verify Shut-off Valve is turned fully open.
	Mounting Block restricted.	Remove Dispensing valve from Mounting Block. Place cup over Carbonated Water outlet on Mounting Block and carefully open Carbonated Water Shut-off Valve. If little or no Carbonated Water is present, Mounting Block is restricted. Remove and clean mounting block. Replace if necessary.
	Flow Control our of adjustment or inoperative.	Readjust Flow Control to proper Brix (5 oz in 4 seconds Standard valve, 10 oz in 4 seconds Fast Flow valve). If no response, clean Carbonated Water Flow Control. Replace if necessary.
	Valve Port restricted.	Clean Carbonated Water valve Port Assembly.
	Seat swollen.	Replace Carbonated Water Seat.
	Solenoid Coil defective.	Replace Carbonated Water Solenoid Coil.
	Carbonated Water Switch defective (black).	Replaced Carbonated Water Switch.

Qualifier	Probable Cause	Corrective Action
No water or insufficient water in finished drinks		
All valves dispensing noncarbonated drinks no water.	Water Shut-off Valve closed or partially closed.	Refer to Troubleshooting "Water Booster System" under **Low or No Water Pressure at Noncarbonated Beverages**.
Problem occurs at only one dispensing valve.		Refer to this section on **No carbonated water at only one dispensing valve in the dispensing valve**.
Too much Syrup, Carbonated Water or Water in finished drink. Problem occurs at only one dispensing valve.	Syrup, carbonated water, or noncarbonated water flow control out of adjustment or inoperative.	Readjust appropriate Flow Control. If Flow Control does not respond to adjustment, clean Flow Control. Replace if necessary. Carbonated Water Flow rates: (5 oz in 4 seconds Standard valve, 10 oz in 4 seconds Fast Flow valve).
Too much syrup in finished drink. All valves dispensing same flavor-too much syrup.	Malfunction of syrup system.	Refer to Troubleshooting "Syrup System" under **Drinks too sweet**.
Too much water in finished drink. All valves dispensing noncarbonated drink too much water.	Malfunction of water Booster system.	Refer to Troubleshooting "Water Booster System" under **Qualifier: Pump and motor cycles ON and OFF excessively**.
Syrup or Carbonated Water or Water dripping from Nozzle.	Valve port scarred.	Disassemble appropriate Syrup or Water Assembly. Examine valve Port for scars or nicks. Replace if necessary.
	Armature Spring or Retaining Ring broken.	Disassemble appropriate Syrup or Water Assembly. Examine Armature, Spring and Retainer Ring. If damaged, replace.
	Seat scarred or obstructed.	Disassemble appropriate Syrup or Water Assembly. Examine Seat, if scarred, replace. If foreign material is found in Assembly, remove, reassemble.
Valves will not activate when Selection Panel pressed. Problem occurs at two (2) or three (3) consecutive Valves on one (1) tower.	Transformer inoperative.	Verify wire leads from Transformer have solid connections. Switch low voltage lead from Transformer supplying power to left and right hand side of Tower. If Valves operate and the other three do not, Transformer is defective. Replace.
	Dispensing tower's **ON** and **OFF** Toggle defective.	If after switching Leads, the three valves still do not operate, the **ON** and **OFF** Toggle Switch is defective.

Qualifier	Probable Cause	Corrective Action
No water or insufficient water in finished drinks (continued)		
Problem occurs at all valves on one (1) dispensing tower.	No power to transformer or transformer defective.	Verify power with a voltmeter at wall outlet. Verify power across low voltage leads on transformer. If 24 volts are present **ON** and **OFF** Toggle Switch is defective. Replace.
Problem occurs at only one (1) dispensing valve.	Dispensing tower's **ON** and **OFF** is Switch defective.	Verify Main Power Supply and power at Transformer Leads replace **ON** and **OFF** Switch if operative.
	Poor connection on valve Wire Harness.	Trace wiring on defective valve and reconnect any loose wires. Clean and reconnect any corroded connections.
	Portion Control Timer inoperative.	Replace the problem valve Portion Control Timer with a known Operative Timer. If valve then operates, Portion Control Timer was defective. Replace.
	Selection Switch inoperative.	Replace defective Portion Control Timer with operative Timer. If Valves still will not activate, Selection Panel is defective. Replace Selection Switch.
	Poor connection at Contact Clips on Selection Panel (with Portion Control Timer).	Examine Contact Clips on Selection Panel and ensure proper contact between Portion Control Timer and Contact Clips.
Valve will not shut **OFF**.	Moisture on Portion Control Timer or Contact Clips.	Remove top cover from Dispensing Tower. Remove all moisture from Portion Control Timer and Contacts.
	Portion Control Timer Adjustment Screw turned beyond control limit.	Turn Portion Control Adjustment Screws on defective valve counterclockwise 10 complete turns. If valve shuts off when selection is pressed, readjust for proper portions. Note: Several revolutions may be necessary to bring control back into range.
	Portion Control Timer defective.	Verify above probables are not the problem. Push **ON/OFF** Switch for Dispensing Tower to the **OFF** position. If valve ceases to dispense when pushed to **ON** position, Portion Control Timer is defective. Replace.
	Selection Panel defective.	Push **ON/OF** Switch for dispensing tower to the **OFF** position. If valve ceases and then continues to dispense when switch is pushed in **ON** position, Selection Panel is defective. Replace.

Qualifier	Probable Cause	Corrective Action
No water or insufficient water in finished drinks (continued)		
Foaming of finished products.	Nozzles, Syrup Tube Diffusers dirty.	Remove and clean Nozzle Assemblies and reassemble.
	Warm drinks.	Refer to Troubleshooting "Refrigeration System" under **Warm drinks**.
	Incorrect pressure on syrup.	Verify pressure supplied to sugar base products is at 60 psi (4.2 kg/cm^2). Adjust Medium Pressure Regulator if necessary. Verify pressure supplied to diet product is at 15 psi (1.1 kg/cm^2). Adjust Low Pressure Regulator if necessary. ***Note:*** *Ensure the Low Pressure Supply Line has not mistakenly been switched for a Medium Pressure Supply Line on the diet tank.*
	Change-over Valve Medium or Low Pressure is in the wrong position.	Verify valve Medium to Low Pressure is in the Low Pressure position for diet products.
	Air or CO_2 gas in syrup line.	Replace empty Syrup Tank. Dispense Syrup from valve until consistent flow is achieved and product stabilizes. If evidence of air is still entering line, replace Liquid Disconnect which is allowing air to be drawn into syrup supply.
	Flake ice.	Only cube ice should be used for carbonated beverages.
	Improper adjustment of valve.	Ensure carbonated water flow is properly set (5 oz. in 4 seconds standard valve, 10 oz in 4 seconds Fast Flow valve). Ensure Brix is properly set. Adjust as necessary.
Unit totally inoperative; all electrical switches in the **ON** position.	Power failure, all power to system is **OFF**, or Fuse/Circuit Breaker is "open".	Check Circuit Breaker. Reset. Examine Time Delay, replace if necessary.

Electrical System

Qualifier	Probable Cause	Corrective Action
Fuse/Circuit Breaker is open.	Short Circuit or overload within unit.	Push Toggle Switches labeled carbonator and circulator to the **OFF** position. Push the Toggle Switches for Booster Pump, Air Compressor, Agitator and Refrigeration to the **OFF** position. Replace fuse(s) and reset circuit breaker. Push the Toggle Switches ON in the following sequence as labeled below, to locate short or overload within unit, waiting momentarily between steps. *Agitator *Refrigeration *Carbonator A and/or B *Circulator A and/or B (after carbonator Motor Cycles **OFF**) *Booster Pump *Air Compressor. Push the Agitator Toggle Switch in the **ON** position. If the fuse/circuit breaker opens, the trouble is in the Agitator Motor Circuit. This Circuit must be checked for shorts and/or overload. If the fuse/circuit breaker does not open after running about 1 minute, the problem is not in the Agitator Motor Circuit. Push the Refrigeration Toggle Switch in the **ON** position. If the fuses/circuit breaker opens, the trouble is in the Refrigeration Circuit. Refer to wiring diagram for possible faulty components. Push the carbonator Toggle Switch A to the **ON** position. Draw Carbonated Water from the Dispensing valve until Pump cycles. If the fuse/circuit breaker opens, the trouble is in the carbonator Circuit. Refer to wiring diagram for possible faulty components. Push the carbonator Toggle Switch B to the **ON** position. Follow procedure above for carbonator A. Push the Circulator Toggle Switch A to the **ON** position. If fuse/circuit breaker opens, the trouble is in the Circulator Circuit. Refer to wiring diagram for possible faulty components. Push the Circulator Toggle Switch B to the **ON** position. Follow procedure above for Circulator A. Push the Booster Pump Toggle Switch to the **ON** position (allow unit to cycle). If fuse/circuit breaker opens, the trouble is in the Booster Pump Circuit. Refer to wiring diagram for possible faulty components. Push the Air Compressor Toggle Switch to the **ON** position. (Allow unit to cycle). If fuse/circuit breaker opens, the trouble is in the Air Compressor Circuit. Refer to wiring diagram for possible faulty components. ***Important Note:*** *Worn out Circuit Breakers or low voltage are frequently responsible for shorts and overloads. Contact service agent to examine possible defective Circuit Breakers or low voltage.*

Refrigeration System

Until repairs can be made on unit with no Ice Bank, push Refrigeration and Agitator Switch to the **OFF** position and ice down Bath using ice from Ice Maker.

Qualifier	Probable Cause	Corrective Action
Warm drinks (carbonated water temperature over 40°F [5°C])		
Compressor operates but no ice present at water bath.	Water Bath Feeder Valve inoperative (not enough water in bath).	Remove tope cover from Remote Refrigeration Unit. Verify if water level is considerably below Stand Pipe. If so, Water Make-Up valve is inoperative. Remove, disassemble and clean out valve. Replace, refill Bath and allow carbonator to cycle while inspecting valve to ensure proper operation. Replace if necessary.
	Water leak inside bath.	Remove top cover from Remote Refrigeration Unit. Inspect Water Bath at Stand Pipe. If considerable water is observed running over and out the drain, there is a water leak inside Bath. The leak causes the Ice Bank to melt as fast as it's formed. Drain Bath to located the leak, repair and refill bath.
	Fan or Motor inoperative (air cooled units).	Examine Fan and Motor on Air Cooled Units at Condenser. If either are found to be inoperative while compressor is running, replace inoperative fan or motor. ***Caution:*** *Inoperative Fan and Motor can cause short cycling of compressor.*
Compressor operates but no ice present at water bath.	Condenser restricted.	For Air Cooled Units, clean the Condenser removing all dust and lint. On Water Cooled Units: Using a thermometer verify temperature at water discharge line. If operating outside of the 95°F (35°C) to 105°F (41°C) range, adjust Water Modulating valve, replace. ***Caution:*** *Restricted Condenser can cause short cycling of compressor.*
	Excessively warm room.	Verify the Refrigeration Unit is operating in a well ventilated area and that there are no obstructions blocking Condenser. If so, remove obstructions if inoperative.
	Lack of Refrigerant Charge.	Examine Sight Glass. If bubbles appear while compressor is operating system is low on charge. Refer to Serial Plate for proper refrigeration charge.
	Defective Expansion valve.	If no bubbles appear in Sight Glass then examine suction line, frost on the suction line is a sign of defective Expansion valve. Replace if inoperative.

Qualifier	Probable Cause	Corrective Action
Warm drinks (carbonated water temperature over 40°F [5°C]) (continued)		
Compressor operates with Ice present at water bath.	Defective Agitator Motor Assembly.	Remove top cover from Remote Refrigeration Unit. Examine the Agitator Motor Assembly, ensure propeller is secured to Agitator and that the Agitator Switch is in the **ON** position, allowing the water in Bath to be agitated across the cooling coils. If Motor or Propeller is inoperative, replace.
	Malfunctioning of Circulating System.	If ice is present on Evaporator Coil and Agitator Motor Assembly is operating the Refrigeration System is functioning. However, the Circulating System may not be functioning. Refer to Troubleshooting “Circulating System”. ***Caution:*** *Always make certain that proper line voltage is present.*
Compressor won’t operate and no ice at water bath.	Defective Switch.	Check to ensure Refrigeration Switch is in the **ON** position.
	Fuse/Circuit Breaker open.	Locate Circuit Breaker box and identify proper breaker for Remote Refrigeration Unit. Ensure it is in the **ON** position by switching **OFF** and then **ON** again. If breaker will not reset, refer to Troubleshooting “Electrical System”.
	Time Delay Fuse burned out.	Inspect Time Delay Fuses at the wall quick shut-off panel. One of the fuses may be burned out causing half the unit to shut down. If this is suspected replace all of the fuses.
	Defective High Pressure Control.	Examine High Pressure Control to ensure wire leads are securely attached to terminals. If trouble is suspected with control, replace.
	Defective Ice Bank Control.	Remove Electrical Access Panel and using a voltmeter across the Ice Bank Control, verify control is in the “closed” position. If control is found to be in the “open” position, that Control should be replaced.
	Defective Contactor.	Remove Electrical Access Panel. Use a voltmeter across Contactor Coil. If current exists across Coil, and Contactor remains “open”, Contactor is defective. Replace.
	Defective Relay or Defective Capacitor or Defective Overload.	Examine Relay/Capacitor/Overload to ensure wire leads are securely attached to terminals. Replace any faulty components.
	Defective compressor.	If after checking each of the above items, you still experience problems, test compressor for possible defects or grounding.

Qualifier	Probable Cause	Corrective Action
No carbonated water at any of the dispensing valves		
CO_2 gas is present at dispensing valves but no Carbonated Water.	Malfunctioning of Carbonating System.	If CO_2 gas is present at the Dispensing Valves and there is no water, the problem is in the Carbonated Water System. Refer to Troubleshooting “Carbonated Water System”.
No CO_2 Gas or water present at dispensing valve.		In a “freeze up” situation, push Refrigeration and Agitator Toggle Switches to the **OFF** position. Drain water from Bath. Pour lukewarm (**never hot**) water over the Product Coils until thawed. Ice down Water Bath using ice from Ice Maker until further repairs can be made.
	Defective Agitator.	Examine the Agitator Motor Assembly. Ensure Propeller is operating and secured to Agitator and that the Agitator Toggle Switch is in the ON position. If Motor is inoperative, replace.
	Defective Ice Bank Control.	Remove Electrical Access Panel. Use a voltmeter across the Ice Bank Control. Verify Control is in the “open” position. If Control is stuck in the “closed” position, the unit will “freeze up”. Replace Control if necessary. If unit builds and Ice Bank to the point of extending into stainless steel coils, the Ice Bank Control must be replaced.
On units equipped with the “Red” Refrigeration Warning Light.	Defective Contactor.	Use a voltmeter across Contactor Coil. If no current is present across Coil, but Contactor remains “closed”, Contactor is defective. Replace defective Contactor.
	Defective Primary Ice Bank Control.	When the Refrigeration Warning Light illuminates, the Primary Ice Bank Control is defective and should be replaced. The Secondary Control operates the Compressor until the Primary Control is replaced.
Refrigeration Warning Light cycles **ON** and **OFF** with Compressor.		***Note:*** *When the Refrigeration Compressor cycles* ***ON****, Warning Light will turn* ***OFF****. When the Compressor cycles* ***OFF*** *the light will illuminate.*

Syrup System

Qualifier	Probable Cause	Corrective Action
No syrup or insufficient syrup in finished drink.	Syrup Tank is empty.	Replace Syrup tank and purge air out of Dispensing Valves affected, until steady syrup supply is dispensed.
	Kinked Syrup lines.	Examine all exposed Syrup Lines and relieve any sharp bends or kinks. ***Note:*** *Observe all independent lines from Syrup Tank to Filters for kinks or bends. Correct as needed.*
	Low Pressure Regulator inoperative.	Low Pressure Regulator controls the pressure to diet beverages. Verify pressure is set at 15 psi (1.1 kg/cm^2). To increase, adjust clockwise, to decrease, adjust counterclockwise. If regulator does not respond, repair or replace regulator.
	Medium Pressure Regulator inoperative.	Medium Regulator controls the pressure applied to the sugar based beverages. Verify pressure is set at 60 psi (4.2 kg/cm^2). To increase, adjust clockwise. To decrease, adjust counterclockwise. If regulator does not respond, repair or replace regulator.
	Check Relief valve restricted.	Disengage Gas Quick Disconnect on suspected restricted flavor at Syrup Tank. Depress Poppet valve on bottom side of Gas Disconnect. If a low or poor pressure supply is apparent, replace Check Relief valve.
	Gas/Syrup Tank Plug Valves inoperative.	Replace Syrup Tank. If this solves the problem, tag defective tank so bottler can make necessary repairs. (It is extremely rare to have inoperative Tank Plug Valves.)
	Quick Disconnects (Gas or Syrup) not fully engaged on Syrup Tank.	Disengage Quick Disconnects on one Tank at a time. Rinse and clean with warm water. Lubricate the O-ring on the Syrup Tank Plug with water. Reattach the Quick Disconnects to the appropriate Syrup Tank Plug. Gas Quick Disconnects are gray or have two key slots. Syrup Quick Disconnects are black or have three key slots.
	Quick Disconnect Valves or Tank Jumper inoperative.	Gas Quick Disconnects: Open the Relief valve on the top of the syrup tank lid. If the Gas Quick Disconnect is opening properly, pressure should continue to bleed from the Gas Relief valve. If not, replace Gas Quick Disconnect. Syrup Quick Disconnects: Open the Dispensing valve (Syrup Side only) for appropriate flavor. Dispensing syrup for at least 10 seconds. If CO_2/Air pockets appear in syrup, replace Syrup Quick Disconnect. If syrup flow is inadequate or fluctuates during 10 seconds of flow, replace Syrup Quick Disconnects.

Qualifier	Probable Cause	Corrective Action
No syrup of insufficient Syrup in finished drink. (continued)	Gas leak at Syrup System.	Use a soap solution around all connections, starting from the Low and Medium Pressure Regulators to the base of the Syrup Tank Plugs, observe Quick Disconnects, Tank Cap and Gasket, Tank Plugs and Syrup Tank O-rings for leaks. Repair and replace if necessary.
	Syrup Filter restricted.	Disengage Syrup Quick Disconnect from the appropriate Syrup Tank. Relieve pressure at the corresponding Dispensing valve. Remove the Screw clamp and the Filter Screen. Wash the Filter Screen with warm water and reassemble.
	Frozen Syrup Coil.	Refer to Troubleshooting “Refrigeration System” under **No carbonated water at any of the dispensing valves (Freeze up)**.
	Dispensing valve inoperative.	Refer to Troubleshooting “Dispensing Valve and Tower” under **No syrup or insufficient syrup**.
Drinks too sweet.	Low Pressure Regulator inoperative.	Verify Low Pressure Regulator set at 15 psi (1.1 kg/cm^2). Adjust Regulator if necessary. If Regulator will not respond, repair or replace Regulator.
	Medium Pressure Regulator inoperative.	Verify Medium Pressure Regulator set at 60 psi (4.2 kg/cm^2). Adjust Regulator if necessary. If Regulator will not respond, repair or replace Regulator.
	Dispensing valve inoperative.	Refer to Troubleshooting “Dispensing Valve and Tower” under **Too much syrup in finished drink**.
Peculiar taste.	Contaminated Syrup.	Replace tank and sanitize the system.

Water Booster System

Qualifier	Probable Cause	Corrective Action
Low or no water pressure at noncarbonated beverages		
Water Booster will not cycle **ON**. Both the pressurized filter water and filtered water pressure register 55 psi (3.8 bar).	No power to Water Booster Pump.	Verify Toggle Switch for "Booster Pump" is in the **ON** position and main power supply is **ON**.
	Pressure Switch defective.	Remove Pressure Switch Cover and use a voltmeter across terminals to determine whether "open" or "closed". If in the "open" position, replace Switch.
	Motor defective.	If Motor will not operate, verify voltage across Motor Terminals with a voltmeter. If voltage reads from 110 to 120 VAC, the Motor is defective and should be replaced.
	Pump frozen.	Loosen the Coupling Clamp with a flat-blade screwdriver and disengage pump from Motor. Turn the Coupling key by hand, in back of pump. If pump shaft will not spin freely, Pump is defective and must be replaced.
Water Booster cycles ON and OFF and pressurized Filtered Water Gauged readings range between 65 psi (4.6 kg/cm^2) to 85 psi (6.0 kg/cm^2).	Water supply shut-off after Booster System.	Examine Shut-off Valve to "Plain Water to Unit" and "Water to Coffee Machine" and ensure both are in the ON position.
	Frozen Water Coil.	Refer to Troubleshooting "Refrigeration System" under **No carbonated water at any of the dispensing valves (freeze up)**.
Pump and Motor will not cycle **OFF**.	Water supply to Booster Pump shut **OFF**.	Examine the Shut-off Valve to Booster Pump and ensure valve is in the **ON** position.
	Restricted Water Filter.	Observe Filter Water Pressure Gauge. If pressure drops total of 40 psi (2.8 bar) or more when pump cycles **ON**. Replace filter.
	Leak on Booster System Pump Strainer obstructed.	Locate water leaks on system and repair. Remove Pump Strainer at Brass Booster Pump, flush screen with water to clean. Reassemble and position in place. Replace screen if necessary.
	Pump Coupling Key defective.	Using a flat-blade screwdriver, loosen Coupling Clamp and disengage Pump from Motor. Examine Coupling Key, if rounded off on either end, replace.
	Pump defective.	Examine Pressurized Filter Water Pressure Gauge. If Pump and Motor continue to operate but fail to build up to 85 psi (6.0 kg/cm^2) in order to cut off, pump is defective. Replace Pump.
	Pressure Switch improperly adjusted or defective.	Observe Pressurized Filtered Water Pressure Gauge to ensure proper cycle **ON** at 65 psi (4.6 kg/cm^2) and cycle **OFF** at 85 psi (6.0 kg/cm^2). Refer to instructions found under Switch Cover for adjusting. If Switch does not respond to adjustment, replace switch.

Qualifier	Probable Cause	Corrective Action
Low or no water pressure at noncarbonated beverages (continued)		
Pump and Motor cycles **ON** and **OFF** excessively.	Leak on Booster System.	Locate water leaks on system and repair.
	Check valve defective.	Observe Filtered Water Pressure Gauge. If pressure rises and drops with Pressurized Filtered Water Gauge, the Water Inlet Check valve on Pump is defective. Replace Check valve.
	Pressure Switch improperly adjusted or defective.	Observe Pressurized Filtered Water Pressure Gauge to ensure proper cycle **ON** at 65 psi (4.6 kg/cm^2) and cycle **OFF** at 85 psi (6.0 kg/cm^2). Refer to instructions found under Switch Cover for adjusting. If Switch will not respond to adjustment, replace switch.
	Accumulator Tank pressure set improperly.	Push Toggle Switch and Water Shut-off Valve to Booster Pump to the **OFF** position. Activate Plain Water button until water flow ceases. Using a tire gauge verify a 60 psi (4.2 kg/cm^2) charge on Tank. Recharge if necessary. ***Note:*** *When charging Accumulator Tank, only AIR should be used.*
	Accumulator Tank bladder ruptured.	Repeat procedures above. If water is found inside Air Chamber when verifying pressure charge, bladder is ruptured. Replace Accumulator Tank.
	Motor overheating.	Using a flat-blade screwdriver, loosen Coupling Clamp and disengage Pump from Motor. Turn Coupling Key by hand, in back of Pump. If Coupling Key is difficult to turn, it may cause defective Motor to overheat. Replace Motor if necessary.
Peculiar taste in Non-carbonated beverages.	Water Filter contaminated.	Replace Filter. Refer to Troubleshooting "Water Filter System" under **Peculiar taste**.
	Accumulator Tank bladder ruptured.	Replace Accumulator Tank. Refer to *"Pump and Motor Cycle **ON** and **OFF** excessively"* Accumulator Tank bladder ruptured.
	Malfunction of Carbonated Water System.	Refer to Troubleshooting "Carbonated Water System" under **Peculiar taste**, *Probable Cause: Back Flow Preventer leaking*.

Water Filter System

Until repairs can be made on the Water Filter, place valve handle into “filter By-pass” position.

Qualifier	Probable Cause	Corrective Action
Carbon particles in finished drink.	Water By-pass valve is not in the “filtering” position.	Verify By-pass valve handle is in the Filter “operating” position. If particles continue to appear, filter must be serviced.
	Defective or damaged seal on Filter Cartridge.	Verify O-rings are not twisted or nicked. Verify Cartridge is solid and free of cracks. Replace if necessary.
	Filter Cartridge installed without Inlet Seal.	Remove Cartridge from Canister. Clean Canister Lid and Shell assembly. Replace with new Filter Cartridge, making sure to remove Water Inlet Seal.
	Defective carbonator Pump.	Refer to Troubleshooting “Carbonated Water System”.
	Defective Circulating Pump.	Refer to Troubleshooting “Circulating System”.
Carbonator and Water Booster Pump extremely noisy.	Restricted Water Filter.	Observe Filter Water Pressure Gauge. If pressure drops at total of 40 psi (2.8 bar) or more when pump cycles **ON**, replace filter.
	Filter Cartridge installed without removing Water Inlet Seal.	Removed Cartridge from Canister. Clean Canister Lid and Shell Assembly. Install new Filter Cartridge, making sure to remove Cartridge Inlet Seal.
	Water supply to Filer restricted.	Verify water supply is turned **ON** to unit. Refer to Troubleshooting “Carbonated Water System” and “Water Booster System” for additional solutions.
Peculiar taste.	Water Filter contaminated.	Place Filter valve into “Filter By-pass” position. Replace Filter and reposition valve handle to “filter operating” position.

When the Brix is OFF

Air Compressor

85 psi (5.9 bar) OFF

Problem	Probable Cause	Solution
Drink too warm.	Refrigeration switch **OFF**.	Turn **ON** refrigeration switch.
	Condenser dirty.	Have condenser cleaned.
	Condenser obstructed.	Remove any objects blocking the air flow in or out of the unit.
	Circulator switch **OFF**.	Turn **ON** circulator switch and allow time for drinks to cool.
		Note: *If service is required, you can continue to dispense cold drinks by completing following this procedure.* 1. Turn **OFF** the compressor switch and agitator switch. 2. Drain the water from the water bath. Reinstall the grey plastic over-flow pipe. 3. Fill water bath with ice from the ice machine. 4. Monitor frequently. Refill as needed.
Not enough carbonation.	CO_2 Shut-off Valve **OFF**.	Open Shut-off Valve.
	CO_2 cylinder empty.	Switch over to a new cylinder and dispense carbonated water until carbonation returns.
Product foaming.	Dirty or sanitizer soaked.	Clean or replace nozzles.
	Warm drinks.	See “Drink too warm” under **Problem** above.
No syrup dispensed.	Empty syrup container.	Replace syrup container.
	Air Compressor is **OFF**.	Turn **ON** and plug-in the Air Compressor.
	Change-over valve centered.	Position switch totally on either air or CO_2.
No carbonated water dispensed.	Carbonator turned **OFF**.	Turn **ON** carbonator switch.
	Water supply turned **OFF**.	Turn **ON** water to the system.
Product has an off taste.	Dirty nozzles.	Clean or replace nozzles.
	Out of date syrup.	Replace with fresh syrup.
	Saturated water filters.	Replace water filters.

Test Procedures: MPC 64A Timer/ Selection Pad

MPC 64 A Timers can be placed in the test mode as follows:

1. Flip power switch off.
2. While depressing “CAL” button on selection pad, flip power switch back on.
3. Release “CAL” button when red LED comes on.

Faucets will energize for 2 seconds, each in sequence, starting with faucet #1 (far left).

Timer is now in the Test Mode. To stop faucets use one of two procedures:

A. Turn power switch off. This will save the programmed times, Use this procedure for testing or sanitizing.

B. Push “CAL” button. All programmed times for all stations will go to factory default times. Default times are:
Size #1 1 - 1.5 seconds
Size #2 4 - 4.5 seconds
Size #3 6 - 6.5 seconds
Size #4 8 - 8.5 seconds

PIN IDENTIFICATION

J-7 = Valve 1 **J-10** = Valve 4

J-8 = Valve 2 **J-11** = Valve 5

J-9 = Valve 3 **J-12** = Valve 6

Check for 24 Volts at each solenoid cable connector, **J-7** through **J-12**, with cables removed.

With cables on, check for 24 VAC across solenoids at dispensing valve while dispensing respective valve.

J-15 Power to Valves 1,2,3.

J-20 Power to Valves 4,5,6 and microprocessor.

Loss of power at **J-15** results on loss of power to valves 1,2,3.

Loss of power at **J-20** results on loss of power to microprocessor — no valves will work.

J-16 Station & Sizes

Revision May 28, 2003

#1 Stop/Fill

#2 Large

#3 Medium

#4 Small

#5 Valve 6 (or nothing on a 5 Valve tower)

#6 Valve 5

#7 Valve 4

#8 Valve 3

#9 Valve 2

#10 Valve 1

#11 Blank

#12 Extra Large

Use a jumper wire to make these connections to determine if timer is functioning properly.

A. Jump pin 1 to pin 5,6,7,8,9,10. Appropriate Valve should energize as long as pins are jumped.

B. Jump pin 12 to pin 5,6,7,8,9,10. Valves should pour EXTRA LARGE.

C. Jump pin 2 to pin 5,6,7,8,9,10. Valves should pour LARGE.

D. Jump pin 3 to pin 5,6,7,8,9,10. Valve should pour MEDIUM.

E. Jump pin 4 to pin 5,6.7,8,9,10. Valves should pour SMALL.

J-17 CALIBRATION BUTTON & LIGHT

If microprocessor does not go into calibration, remove connector at J-17. With jumper wire, jump 1st and 2nd pins on left 3 times in less than 3 seconds. Replace connector. Calibration light should be on (microprocessor will be in the calibration mode). White & White = calibration button. Red & Black = calibration light. If CAL light does not come on LED is burned out — replace keyboard.

Dual Transformers

DUAL TRANSFORMERS MUST BE WIRED IN PHASE

To determine whether transformers are wired in phase: With power on, take voltage reading at HOT wire of each transformer. Reading should be **0 VOLTS***. If you read voltage, transformers are out of phase. The positions of the wires on one transformer must be switched.

*Black to White = 24V AC +/-10%
Black to Black = 0 V AC

New MPC84A Portion Control Board

A new portion control board, the MPC84A, has been developed to improve the performance and maintain the functions and features of the previous MPC64A. In addition this PC board has passed the very demanding EMC testing (radio frequency emissions and interference) for European CE approval, at the UL labs. The MPC64A has been phased out as of 6/96 and only the MPC84A will be used on new production and service.

The new board is the same size, same mounting locations, and uses the same connectors as the previous board. This article is to explain some minor differences and features which can be used to your advantage.

The major difference is with the same size board, the MPC84A can control up to eight stations (dispensing valves), with up to four sizes per station. The MPC64A could only control up to six stations.

The first drawing depicts the connectors on the MPC64A.

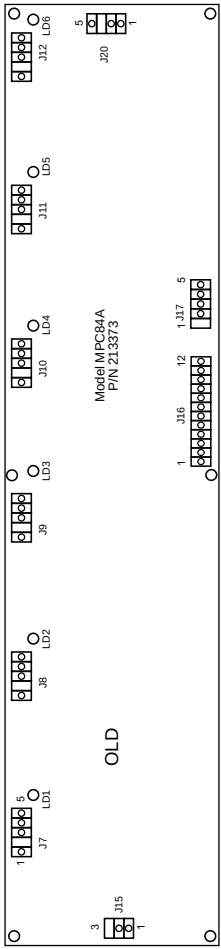
The second drawing depicts the connectors on the MPC84A.

The Power connectors J15 and J20 (24VAC) are the same. The Keyboard connectors J16 for touchpad sizes and J17 for calibration touchpad and light, are the same.

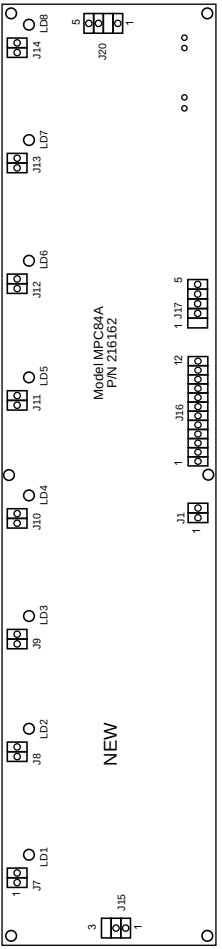
The MPC 84A adds one more two pin keyboard connector J1. For an eight station tower, this connector, along with a separate two wire cable to the proper Keyboard, provides the two extra stations.

The five pin valve connectors, J7 to J12 on the MPC64A are changed to two pin connectors, J7 to J14 on the MPC84A. These valve connectors are not polarized (does not matter how you connect the two pins) except when the valve has a WATER or SODA harness.

The calibrating functions of the new portion control board are the same as the old board.



MPC64A Connectors



MPC84A Connectors

FEATURES OF THE NEW MPC84A

- Can control up to 8 stations (valves).
- Hardware isolation and zero switching to minimize electrical problems.
- Software improvements to noise.

CALIBRATION INSTRUCTIONS

(same as MPC64A)

1. To enter calibrate mode, press calibrate switch three times in less than three seconds, and red calibrate light will illuminate.
2. Place volume cup under nozzle of the valve to be calibrated.
3. Press appropriate size switch and fill volume cup to a point just short of the calibration mark on the volume cup.
4. Let foam settle, jog size switch until liquid reaches the appropriate calibration mark on the volume cup.
5. To calibrate additional sizes, repeat steps 2 thru 4.

Special Features when in the Calibrate Mode

- To obtain an accurate 4.0 seconds pour from any valve, press its associated STOP-FILL switch once.
- To adjust all stations for the same size times, press any station STOP-FILL switch twice in less than two seconds, then repeat steps 2 thru 4 at this station. The resulting times will be copied to all stations when calibrate mode is exited.

Important

Use this mode, one size adjusts all, only for an emergency (no time to adjust at all) and temporarily. Each valve flow rate, ratio, and flow regulators would have to be perfectly identical for each valve to duplicate the same volume in the same portion time.

6. To exit the calibrate mode, press calibrate switch once and red calibrate light will go out.

NOTE: The new MPC84A does not have factory default set times, like the MPC64A does. If a portion size or station looses its calibration, the time(s) will go back to minimum (.5 seconds). This means you can check the total operation of the MPC84A by initiating the TEST/CYCLING option, without changing the calibration times, which could happen with the old MPC64A.

TEST / CYCLING OPTION

1. Turn the power OFF to the tower/portion control.
2. Hold the calibrate switch ON and turn the power ON at the same time.
3. The calibrate LED will illuminate, let OFF the calibrate switch.
4. The dispensing valves will sequence from left to right, valve #1 ON 4 seconds, then valve #2 ON 4 seconds etc., continuously repeating, until you turn the power OFF, or press the calibrate button once. This allows you to see that all valves work. The keyboard or valve harness would have to be at fault, if all the circuit board LEDs (LD1-LD8) illuminate properly, and a valve or valves do not dispense.

Secondly, this sequencing can be used to purge or sanitize the system automatically. If you want more than one valve at a time to dispense automatically for 4.0 seconds, just press station number for number of valves simultaneously. That is, when in the cycling sequence press station #2 (counting left to right) for two valves simultaneous, meaning valve #1 and #2 will dispense for 4 seconds, then #3 and #4, etc., continuously repeating until you turn the power OFF or press the calibrate button once. If you press the station #3, then 1 and 2 and 3 stations will dispense simultaneously, then 4 and 5 and 6, etc. This allows you to have as many valves purging/sanitizing, as the drain will allow without overflowing.

RETROFITTING

When using the MPC84A as a service replacement part, only the valve connectors have to be watched. The power connectors and the keyboard connectors

are the same and go in the same places. The older 5 pin valve connectors will fit on the new board, as long as you observe that the 5 pin connector goes on with the two wires aligned to the two pins on the new board. In case of the WATER and SODA switch harness, it must be polarized, so reverse (connector moved 180°) if WATER or SODA does not pour.

MOVs Field Testing

Metal Oxide Varistors installed on the water and carbonated water buttons on, McDonalds style dispensing towers, are designed to completely absorb electrical spikes keeping them out of the microprocessor circuit eliminating complaints of:

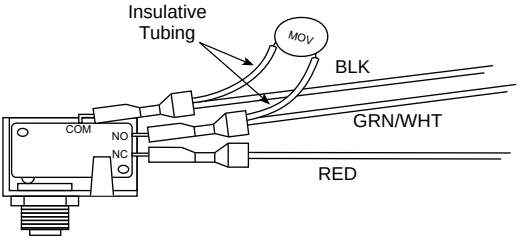
- Not holding calibration
- Valves flowing by themselves
- Two valves coming on at the same time, etc.

Multiplex has designed a field test procedure that will expose a faulty MOV. This procedure will also work on the older style capacitors.

The field test procedure:

Depress **separately** both the water and soda water button rapidly 5 - 6 times. While doing this, watch all other valves. If you notice any dripping or any other valve trying to energize, the MOVs need to be replaced.

NOTE: Factory installed MOVs have heat shrink tubes on each terminal leg. Always check to make sure that heat shrink has not slipped down and is insulating the MOV leg inside the terminal connector.



Test Procedures: MPC84C Timer/ Selection Board

MPC 84B timers can be placed in the test mode as follows:

1. Flip power switch OFF.
2. While depressing CAL button on selection pad, flip power switch ON.
3. Release CAL button when red LED comes on.

Faucets will energize for 4 seconds, each in sequence, starting with faucet #1 (far left). Timer is now in the Test Mode. To stop faucets, use one of two procedures.

- Turn power switch off. This will save the programmed times. Use this procedure for testing or sanitizing.
- Push CAL. All programmed times will be saved.

PIN IDENTIFICATION

J-1 = Valve 1	J-6 = Valve 6
J-2 = Valve 2	J-7 = Valve 7
J-3 = Valve 3	J-8 = Valve 8
J-4 = Valve 4	J-9 = Soda
J-5 = Valve 5	J-10 = Water

Check for 24 Volts at each solenoid cable connector, J-1 through J-8, with cables removed.

With cables on, check for 24VAC across solenoids at dispensing valve while dispensing respective valve.

J-15 Power to valves 1, 2, 3, 4 and microprocessor

J-20 Power to valves 5, 6, 7, 8 and microprocessor

Loss of power at J-15 results in loss of power to valves 1, 2, 3, and 4.

Loss of power at J-20 results in loss of power to valves 5, 6, 7, and 8.

J-16 Station and Sizes:

#1	Stop/Fill
#2	Large
#3	Medium
#4	Small
#5	Valve 6
#6	Valve 5
#7	Valve 4
#8	Valve 3
#9	Valve 2
#10	Valve 1
#11	Blank
#12	Extra Large

J-18 Stations

#1	Valve 7
#2	Valve 8

J-19 Stations and Sizes:

#1	Blank
#2	Valve 2 or 4 Flavor 1
#3	Valve 2 or 4 Flavor 2
#4	No wire
#5	Kid Size (Smallest)

Use a jumper wire to make these connections to determine if timer is functioning properly.

1. Jump pin 1 on J-16 to pin 5, 6, 7, 8, 9, 10, and pins 1 and 2 on J-18. Appropriate valve should energize as long as pins are jumped.
2. Jump pin 12 on J-16 to 5, 6, 7, 8, 9, 10, and pins 1 and 2 on J-18. Valves should pour Extra Large.
3. Jump pin 2 on J-16 to 5, 6, 7, 8, 9, 10, and pins 1 and 2 on J-18. Valves should pour Large.
4. Jump pin 3 on J-16 to 5, 6, 7, 8, 9, 10, and pins 1 and 2 on J-18. Valves should pour Medium.
5. Jump pin 4 on J-16 to 5, 6, 7, 8, 9, 10, and pins 1 and 2 on J-18. Valves should pour Small.
6. Jump pin 5 on J-19 to J-16 pins 5, 6, 7, 8, 9, 10, and pins 1 and 2 on J-18. Valves should pour Kid Size.

J-17 CALIBRATION BUTTON AND LIGHT

If microprocessor does not go into calibration, remove connector at J-17. With jumper wire, jump 1st and 2nd pins on left 3 times in less than 3 seconds. Replace connector. Calibration light should be on (microprocessor will be in the calibration mode). White & white = calibration button. Red & black = calibration light. If CAL light does not come on, LED is burned out — replace keyboard.

SECONDARY BOARD PIN IDENTIFICATION

J-1 = Valve 2 Flavor 1

J-2 = Valve 2 Flavor 2

J-3 = Valve 4 Flavor 1

J-4 = Valve 4 Flavor 2

Use a jumper wire to make these connections to determine if timer is functioning properly.

1. Jump pin 2 or 3 on J-19 and pin 7 or 9 on J-16. Then jump pin 1 on J-16 to pin 7 or 9 on J-16. Appropriate valve should energize as long as pins are jumped.
2. Jump pin 2 or 3 on J-19 and pin 7 or 9 on J-16. Then jump pin 12 on J-16 to pin 7 or 9 on J-16. Appropriate valve should pour Extra Large.
3. Jump pin 2 or 3 on J-19 and pin 7 or 9 on J-16. Then jump pin 2 on J-16 to pin 7 or 9 on J-16. Appropriate valve should pour Large.
4. Jump pin 2 or 3 on J-19 to pin 7 or 9 on J-16. Then jump pin 3 on J-16 to pin 7 or 9 on J-16. Appropriate valve should pour Medium.
5. Jump pin 2 or 3 on J-19 to pin 7 or 9 on J-16. Then jump pin 4 on J-16 to pin 7 or 9 on J-16. Appropriate valve should pour Small.
6. Jump pin 2 or 3 on J-19 to pin 5 on J-19. Then jump pin 5 on J-19 to pin 7 or 9 on J-16. Appropriate valve should pour Kid Size.

Back-flow Preventer Maintenance

The integral carbonator in this unit is equipped with a back-flow preventer designed to protect the potable water supply from CO_2 contamination.

Important

The back-flow preventer must be checked at least once every year to confirm that it is functioning properly.

1. Shut OFF power to unit.
2. Shut OFF potable water supply to unit. Do not shut OFF CO_2 supply.
3. Remove top cover panel of unit and disconnect inlet fitting from back-flow preventer.

NOTE: The carbonator tank is still pressurized.

4. Observe inlet of backflow preventer #1 check for any discharge. If there is no discharge, #1 check is OK. Proceed to step 5. If there is discharge, proceed to step 6.
5. Disconnect and carefully remove #1 check assembly. Avoid losing any internal parts.
6. Observe inlet of #2 check for any discharge. If there is no discharge, #2 check is OK. Proceed to step 7. If there is discharge, proceed to step 5.
7. Shut OFF CO_2 supply and relieve pressure from carbonator tank.
8. Remove back-flow preventer and install new backflow preventer. Turn ON CO_2 supply and check for leaks.
9. Check water supply strainer upstream of backflow preventer. Clean out and/or replace as required.
10. Reconnect water lines and turn water supply ON.
11. Turn ON power to unit.

Head Pressure Control Valve

Multiplex remote systems require head pressure control valves with special settings. Replace defective head pressure control valves only with “original” Multiplex replacement parts.

OPERATION

The R404A head pressure control valve is non adjustable.

At ambient temperatures of approximately 70°F (21°C) or above, refrigerant flows through the valve from the condenser to the receiver inlet. At temperatures below this (or at higher temperatures if it is raining), the head pressure control dome’s nitrogen charge closes the condenser port and opens the bypass port from the compressor discharge line.

In this modulating mode, the valve maintains minimum head pressure by building up liquid in the condenser and bypassing discharge gas directly to the receiver.

DIAGNOSING

1. Determine if the coil is clean. Air passes through the condenser from the bottom up. Verify the coil is clean by looking from the bottom up. Do not look down through the fan.
2. Determine the air temperature entering the remote condenser.
3. Determine if the head pressure is high or low in relationship to the outside temperature. (Refer to the proper “Normal Operating Pressures of Refrigeration Units” in the Charts section.)
4. Determine the temperature of the liquid line entering the receiver by feeling it. This line is normally warm; “body temperature.”
5. Using the information gathered, refer to the chart below.

NOTE: A head pressure control valve that will not bypass, will function properly with condenser air temperatures of approximately 70°F (21°C) or above. When the temperature drops below 70°F (21°C), the head pressure control valve fails to bypass and the ice machine malfunctions. Lower ambient conditions can

be simulated by rinsing the condenser with cool water during the freeze cycle.

Condition	Probable Cause	Corrective Measure
Discharge Pressure - High Liquid Line Temperature - Hot	Valve stuck in bypass	Replace valve
Discharge Pressure - Low Liquid Line Temperature - Cold	Valve not bypassing	Replace valve
Discharge Pressure - Low Liquid Line Temperature - Hot	Ice Machine Low on Charge	Low on Charge Verification

FAN CYCLE CONTROL VS. HEAD PRESSURE CONTROL VALVE

A fan cycle control cannot be used in place of a head pressure control valve. The fan cycle control is not capable of bypassing the condenser coil and keeping the liquid line temperature and pressure up.

This is very apparent when it rains or the outside temperature drops. When it rains or the outside temperature drops, the fan begins to cycle on and off. At first, everything appears normal. But, as it continues raining or getting colder, the fan cycle control can only turn the fan off. All the refrigerant must continue to flow through the condenser coil, being cooled by the rain or low outside temperature.

This causes excessive sub-cooling of the refrigerant. As a result, the liquid line temperature and pressure are not maintained for proper operation.

Charging Multiplex Remote Refrigeration Unit

NOTE: System would have been opened for repairs. Once completed, a vacuum of 500 microns would have been maintained for 1/2 hour. The proper procedure for charging the system includes the reintroduction of all refrigerant that had been recovered before making the repair.

1. Attach charging hose of gauge manifold to liquid valve of the recovery cylinder (if no refrigerant was in the system, and thus, no refrigerant was recovered, attach charging hose to Refrigerant cylinder). Open cylinder valve.
2. Place cylinder on charging scale-zero scale.
3. Open high side valve wheel of gauge manifold. DO NOT ATTEMPT TO CHARGE SYSTEM ON LOW SIDE—CHARGE IN A LIQUID STATE ONLY WITH REFRIGERATION SYSTEM OFF.
4. Allow sufficient time for all refrigerant to transfer from cylinder to refrigeration unit. If necessary, put cylinder into bucket of hot water to increase the internal pressure of the cylinder.
5. System total charge is the net result of:
   A. Refrigeration Unit charge on nameplate
   B. Remote line set length X .72 oz./ft.
   C. 90% of condenser volume (cu. ft.) x Refrigerant (wt./cu ft)

NOTE: Refrigerant weight varies with temperature. R-404A weighs 72 lb/cu. ft. @ 32°; 62 lb/cu. ft. @ 95°

6. When all refrigerant has been transferred, close valve wheel of the manifold.
7. Turn refrigeration unit on.

Alternate Wiring
When the supply voltage is 230/115 VAC, disconnect autotransformer (0021035) from the circuit.

1. Disconnect incoming power.
2. Remove transformer box cover.
3. Remove wire nut from black lead to H4.
4. Replace wire nut on exposed end of black lead.
5. Remove both red leads from (H1 and X1).
6. Connect red leads together with a wire nut.
7. Replace cover.

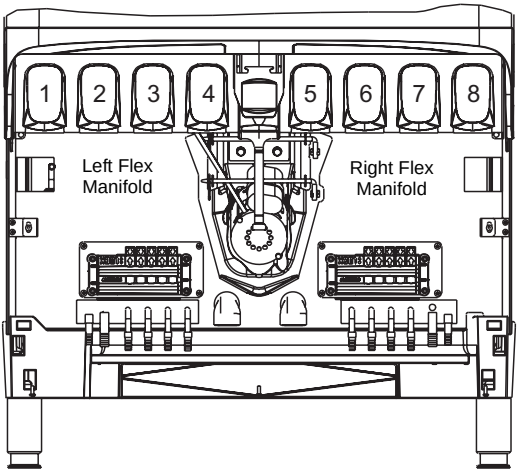
SERVEND RECOMMENDED PLUMBING

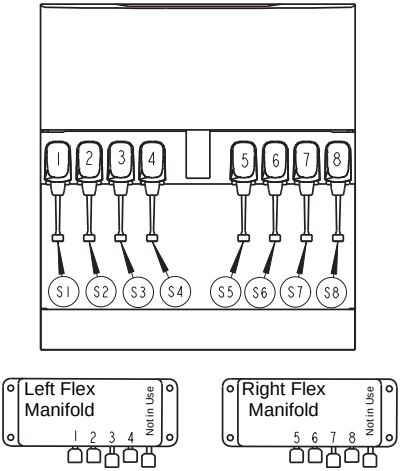
S-250M Plumbing Diagram



Manifold: Change to carbonated or non-carbonated water.

1. Rotate plunger 180° using a 5/32" Allen wrench.
2. Pull plunger out to get non-carbonated water.
3. Push plunger in to get carbonated water.
4. Turn plunger back 180° to lock.

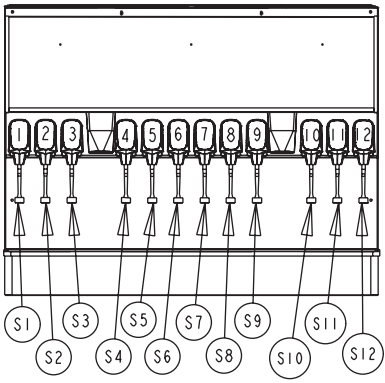
MII-250 Plumbing Diagram

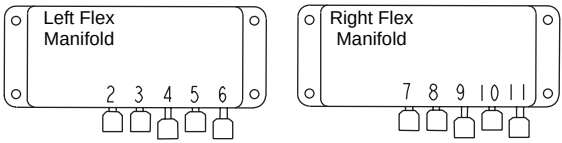


Manifold: Change to carbonated or non-carbonated water.

1. Rotate plunger 180° using a 5/32" Allen wrench.
2. Pull plunger out to get non-carbonated water.
3. Push plunger in to get carbonated water.
4. Turn plunger back 180° to lock.

MII-302 Plumbing Diagram





Manifold: Change to carbonated or non-carbonated water (S2-SII only).

1. Rotate plunger 180° using a 5/32" Allen wrench.
2. Pull plunger out to get non-carbonated water.
3. Push plunger in to get carbonated water.
4. Turn plunger back 180° to lock.
